World-Class Instructional Design and Assessment

# Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ 2.0 Paper English Language Proficiency Test, Series 400, 2015-2016 Administration 

Annual Technical Report No. 12B

Prepared by:

Center for Applied Linguistics
Language Assessment Division
Psychometrics and Quantitative Research Team

May 2017
© 2017 Board of Regents of the University of Wisconsin System on behalf of the WIDA Consortium.

## The WIDA ACCESS for ELLs Technical Advisory Committee

This report has been reviewed by the WIDA ACCESS for ELLs Technical Advisory Committee (TAC), which is comprised of the following members:

- Jamal Abedi, Ph.D., Professor, Graduate School of Education, University of California, Davis and a research partner at the National Center for Research on Evaluation, Standards, and Student Testing (CRESST)
- Lyle Bachman, Ph.D., Professor Emeritus, Applied Linguistics, University of California, Los Angeles
- Akihito Kamata, Ph.D., Professor, Department of Education Policy and Leadership, Department of Psychology, Southern Methodist University.
- Timothy Kurtz, Hanover High School, Hanover, New Hampshire
- Carol Myford, Ph.D., Associate Professor, Educational Psychology, University of Illinois at Chicago.

More information on the TAC members can be found at the WIDA website (www.wida.us/assessment/access/TAC/index.aspx).

## Executive Summary

This is the 12th annual technical report on the ACCESS for ELLs® English Language Proficiency Test, and the first report on the ACCESS for ELLs 2.0 assessment. ACCESS for ELLs 2.0 measures the same constructs and uses the same scale as ACCESS for ELLs, but for the first time, the assessment is offered in an online, multi-stage adaptive format.

This technical report is produced as a service to members and potential members of the WIDA Consortium. The technical information herein is intended for use by those who have technical knowledge of test construction and measurement procedures, as stated in Standards for Educational and Psychological Testing (American Educational Research Association, American Psychological Association, National Council on Measurement in Education, 2014).

ACCESS for ELLs is intended to assess reliably and validly the English language development (ELD) of English language learners (ELLs) in Grades K-12 according to WIDA 2012 Amplification of the English Language Development Standards Kindergarten-Grade 12 (WIDA Consortium, 2012). Results on ACCESS for ELLs are used by WIDA Consortium states for monitoring the progress of students, for making decisions about exiting students from language support services, and for accountability.

ACCESS for ELLs 2.0 Series 400 was administered in school year 2015-16 in 36 states, the District of Columbia, and the Commonwealth of the Northern Marianas, for a total of 38 state entities (henceforth "states"). ACCESS for ELLs 2.0 Series 400 was offered in two administrative formats, an online format (grades 1-12) and a paper format (kindergarten-grade 12). Table 0.1 summarizes the numbers of students, by state, who participated in the grades $1-12$ assessment online, in the grades $1-12$ assessment on paper, the total number of students who participated in the grades $1-12$ assessment, the total number who participated in the Kindergarten assessment (only offered in the paper format), and the total participants in ACCESS K-12. The current report (WIDA ACCESS Technical Report 12B) provides technical information pertaining to ACCESS for ELLs 2.0 Series 400 Paper, including the Kindergarten assessment. A second report (WIDA ACCESS Technical Report 12A) provides technical information for the ACCESS for ELLs Series 2.0 Series 400 Online assessment.

| VT | 1,243 | 15 | 1,258 | 180 | 1,438 |
| WI | 41,378 | 215 | 41,593 | 5,601 | 47,194 |
| WY | 2,196 | 163 | 2,359 | 425 | 2,784 |
| Total | 1,148,337 | 445,551 | 1,593,888 | 245,920 | 1,839,808 |

This report follows the same structure as the ACCESS 1.0 technical reports. The report first provides background to the test (Chapter 1), followed by an argument-based validation framework to support the use of ACCESS for ELLs and to contextualize the data so that its interpretation and use are more transparent to stakeholders (Chapter 2). The rest of the report consists of paired chapters. The first chapter within each pair contains text that explains the data tables that follow in the second chapter. Information on the students who participated in the operational administration is presented (Chapters 3 and 4), followed by an explanation of the technical analyses conducted on each of the test forms that constitute ACCESS for ELLs 2.0 (Chapter 5) and the tables and figures of results (Chapter 6). The final chapters explain (Chapter 7) and present (Chapter 8) technical analyses based on the domain scores and composite scores by grade-level cluster. Note that Chapters 1-4 are in Volume 1, Chapters 5-6 are in Volume 2, and Chapters 7-8 are in Volume 3.

## Summary Highlights

This report presents a wealth of data documenting the technical properties of ACCESS for ELLs 2.0 Series 400 Paper, which cannot be fully summarized here. In addition to information on validity, the report presents information on reliability of test scores and the accuracy and consistency of proficiency level classifications, including information on conditional standard errors of measurement and a separate table highlighting conditional standard errors around the cut scores. Item-level analyses include item difficulty levels, fit of the items to the Rasch measurement model, and differential item functioning (DIF) analyses for each item or assessment task.

## Launch of ACCESS 2.0

Series 400 Paper is the first series of the ACCESS 2.0 assessment. ACCESS 2.0 is now offered in two formats. The Paper format is available for grades $\mathrm{K}-12$, and the Online format is available for grades 1-12. The cluster structure of ACCESS 2.0 Paper has been updated from the cluster structure of ACCESS 1.0. ACCESS for ELLs Paper Series 400 has the following grade-level clusters: K, 1, 2, 3, 4-5, 6-8, 9-12.

The Listening and Reading assessments were developed within the scope of ACCESS 1.0. The majority of Listening and Reading forms are the same forms as were used on ACCESS for ELLs Series 302. Writing and Speaking were developed as a part of ACCESS 2.0, and the Writing and Speaking tasks are paperized versions of the Online Writing and Speaking tasks.

## Argument-based validation framework for ACCESS for ELLs

Starting with Series 301, Chapter 2 of the ACCESS for ELLs Annual Technical Report consists of an argument-based framework for supporting the validity of ACCESS for ELLs. This framework structures the information contained in this Annual Technical Report to support assertions about data collected via the assessment (i.e., Assessment Records). Specifically, tables and figures from this report are explicitly linked to claims related to Assessment Records through
an Assessment Use Argument (AUA), which allows stakeholders to better interpret and use ACCESS for ELLs.

## Demographic data

The Series 400 Paper data set for analyses included the results of 691,471 students. The largest grade was Kindergarten with 245,920 students, while the smallest was Grade 12 with 10,563 students. Of the participating WIDA states, the largest was Florida with 259,296 students, while the smallest was Northern Mariana Islands with 44 students.

## Reliability and accuracy data

For most test users, the Overall Composite proficiency score, based on performances in Listening, Speaking, Reading, and Writing, is the major score used for making decisions about gains in student proficiency and exiting from language support services.

Results indicate that the reliability (stratified Cronbach's alpha, see 7.2.6 in Volume 3) of the Overall Composite score for Series 400 Paper, presented in Chapter 8 Table D, is very high across all grade-level clusters. For Kindergarten it was .974; for Grade 1, .932; for Grade 2, .937, for Grade 3, . 939 , for Grades 4-5, .939; for Grades 6-8, .937; and for Grades 9-12, . 943 . Likewise, as Table 0.1 shows, the accuracy of classification for decisions about student placement using the Overall Composite score around the proficiency level cut scores is very high across grade and proficiency levels. Because many WIDA Consortium states use the proficiency level score of 5.0 as a criterion for exiting students from language support services, the column headed $4 / 5$ Cut (the proficiency level score of 5.0 ) is of particular interest.

Table 0.2
Accuracy of Classification of Overall Score at Cut Points (Proficiency Level Score)

| Grade | $\mathbf{1 / 2}$ Cut <br> $(\mathbf{2 . 0})$ | $\mathbf{2 / 3}$ Cut <br> $\mathbf{( 3 . 0 )}$ | $\mathbf{3 / 4}$ Cut <br> $\mathbf{( 4 . 0 )}$ | $\mathbf{4 / 5}$ Cut <br> $\mathbf{( 5 . 0 )}$ | $\mathbf{5 / 6}$ Cut <br> $(\mathbf{6 . 0})$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| K (instructional) | 0.975 | 0.957 | 0.949 | 0.955 | 0.953 |
| K (accountability) | 0.952 | 0.952 | 0.961 | 0.959 | 0.991 |
| 1 | 0.978 | 0.936 | 0.909 | 0.952 | 0.988 |
| 2 | 0.978 | 0.956 | 0.905 | 0.887 | 0.984 |
| 3 | 0.991 | 0.974 | 0.938 | 0.907 | 0.906 |
| 4 | 0.992 | 0.980 | 0.942 | 0.905 | 0.885 |
| 5 | 0.989 | 0.974 | 0.935 | 0.896 | 0.911 |
| 6 | 0.986 | 0.966 | 0.924 | 0.858 | 0.982 |
| 7 | 0.980 | 0.957 | 0.912 | 0.878 | 0.988 |
| 8 | 0.976 | 0.950 | 0.908 | 0.894 | 0.994 |
| 9 | 0.972 | 0.954 | 0.931 | 0.909 | 0.925 |
| 10 | 0.975 | 0.951 | 0.927 | 0.917 | 0.940 |
| 11 | 0.978 | 0.952 | 0.923 | 0.913 | 0.926 |
| 12 | 0.982 | 0.956 | 0.921 | 0.870 | 0.944 |

## Overview of the Annual Technical Report

The multistate WIDA Consortium's ACCESS for ELLs was first operationally administered in 2005 in three states: Alabama, Maine, and Vermont. Results of that administration were reported in Annual Technical Report 1 (Series 100, 2004-05). This is the twelfth technical report.

Because of the size of the complete report, it is presented in three volumes.
Volume I contains Chapters 1 to 4 . Chapter 1 provides background to the test. Readers unfamiliar with ACCESS for ELLs should pay particular attention to this chapter. Chapter 2 presents an argument-based approach for structuring the data contained in this report so that its interpretation and use are more transparent to stakeholders. Chapters 3 and 4 present information on the students who participated in the Series 400 Paper (2015-2016) operational administration, including overall results.

Volume II contains Chapters 5 and 6. Chapter 5 presents background on the technical analyses conducted on each of the test forms and explains how to understand the tables and figures of results. Chapter 6 presents the results organized by

- Grade-level cluster (K, 1, 2, 3, 4-5, 6-8, 9-12); then by
- Domain (Listening, Reading, Writing, and Speaking, abbreviated List, Read, Writ, and Spek, respectively); then by
- Tier (A, B, C)

Thus, all of the results for Kindergarten are presented before the results for Grade 1, and all of the results for Grade 1 Listening are presented before results for Grade 1 Reading.

Volume III contains Chapters 7 and 8. These chapters focus on results across tiers within gradelevel clusters, including the four composite scores (Oral Language, Literacy, Comprehension, and Overall). Chapter 7 presents background on the technical analyses and explains how to understand the tables and figures of results. Chapter 8 presents the results organized by

- Grade-level cluster (K, 1, 2, 3, 4-5, 6-8, 9-12); then by
- Score (Listening, Reading, Writing, Speaking, Oral Language Composite, Literacy Composite, Comprehension Composite, and Overall Composite, abbreviated List, Read, Writ, Spek, Oral, Litr, Cphn, and Over, respectively)

## Annotated Bibliography

## Technical Reports

The multistate WIDA Consortium's ACCESS for ELLs was first operationally administered in 2005 in three states: Alabama, Maine, and Vermont. Results of that administration were reported in Annual Technical Report 1 (Series 100, 2004-2005). This is a list of reports that describe the development of ACCESS for ELLs.

Center for Applied Linguistics (2015). ACCESS for ELLs Series 302 Media-Based Listening Field Test Technical Brief. (WIDA Consortium).

This report provides detailed information on the conceptualization, development, and field testing of the ACCESS for ELLs Media-Based Listening Test.

Gottlieb, M., \& Boals, T. (2005). Considerations in Reconfiguring Cohorts and Resetting Annual Measurable Achievement Objectives (AMAOs) based on ACCESS for ELLs Data (WIDA Consortium Technical Report No. 3).

This report is intended to assist states with the transition to a standards-based test and determining their AMAOs using ACCESS for ELLs.

Gottlieb, M. \& Kenyon, D. M. (2006). The Bridge Study between Tests of English Language Proficiency and ACCESS for ELLs (WIDA Consortium Technical Report No. 2). This report provides the background, procedures, and results of a study intended to establish estimates of comparability between ACCESS for ELLs and four other English language tests used by Consortium member states. Students in Illinois and Rhode Island were administered ACCESS for ELLs along with one of the other four tests, and results on the four tests were compared with results on ACCESS for ELLs. Results allow states, districts, and schools to understand and report ACCESS for ELLs scores and to establish continuity between previous tests and ACCESS for ELLs.

Kenyon, D. M. (2006). Development and Field Test of ACCESS for ELLs (WIDA Consortium Technical Report No. 1).

This report provides detailed information on the conceptualization, development, and field testing of ACCESS for ELLs. It also provides technical data on equating and scaling procedures, standard setting and operational score reporting, analyses of reliability and errors of measurement, and two initial validity studies.

Kenyon, D. M., Ryu, J. R., \& MacGregor, D. (2013). Setting Grade Level Cut Scores for ACCESS for ELLs (WIDA Consortium Technical Report No. 4).

This report describes the technical procedures and outcomes of the process to move from grade-level cluster cut scores to grade-level cut scores. Proposed cut scores were determined mathematically and then reviewed and revised in a standard-setting process involving 75 teachers from 14 WIDA Consortium states.

MacGregor, D., Kenyon, D. M., Gibson, S., \& Evans, E. (2009). Development and Field Test of Kindergarten ACCESS for ELLs. (WIDA Consortium).

This report provides detailed information on the conceptualization, development, and field testing of Kindergarten ACCESS for ELLs. It also provides technical data on
equating and scaling procedures, standard setting and operational score reporting, and analyses of reliability and errors of measurement.

## Annual Technical Reports for ACCESS for ELLs

Below is a list of annual technical reports for ACCESS for ELLs, listed by year of publication. These reports provide extensive analysis of the results from the operational administrations of ACCESS for ELLs. They provide detailed information on student results broken down by gradelevel cluster, grade, and tier. They also provide detailed information on test and item characteristics.

Kenyon, D. M., MacGregor, D., Ryu, J. R., Cho, B., \& Louguit, M. (2006). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 100, 20042005 Administration (WIDA Consortium Annual Technical Report No. 1).

Kenyon, D. M., MacGregor, D., Louguit, M., Cho, B., \& Ryu, J. R. (2007). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 101, 20052006 Administration (WIDA Consortium Annual Technical Report No. 2).

MacGregor, D., Louguit, M., Ryu, J. R., Kenyon, D. M., \& Li, D. (2008). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 102, 20062007 Administration (WIDA Consortium Annual Technical Report No. 3).

MacGregor, D., Louguit, M., Huang, X., \& Kenyon, D. M. (2009). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 103, 2007-2008 Administration (WIDA Consortium Annual Technical Report No. 4).

MacGregor, D., Louguit, M., Yanosky, T., Fidelman, C. G., Pan, M., Huang, X., \& Kenyon, D. M. (2010). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 200, 2008-2009 Administration (WIDA Consortium Annual Technical Report No. 5).

Yanosky, T., Yen, S., Louguit, M., MacGregor, D., Zhang, Y., \& Kenyon, D. M. (2011). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 201, 2009-2010 Administration (WIDA Consortium Annual Technical Report No. 6).

Yanosky, T., Chong, A., Louguit, M., Olson, E., Choi, Y., MacGregor, D., . . .Kenyon, D. M. (2012). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 202, 2010-2011 Administration (WIDA Consortium Annual Technical Report No. 7).

Yanosky, T., Amos, M., Cameron, C., Louguit, M., MacGregor, D., Yen, S., \& Kenyon, D. M. (2013). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 203, 2011-2012 Administration (WIDA Consortium Annual Technical Report No. 8).

Center for Applied Linguistics (2014). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 301, 2012-2013 Administration (WIDA Consortium Annual Technical Report No. 9).

Center for Applied Linguistics (2015). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 302, 2013-2014 Administration (WIDA Consortium Annual Technical Report No. 10).

Center for Applied Linguistics (2016). Annual Technical Report for ACCESS for ELLs ${ }^{\circledR}$ English Language Proficiency Test, Series 303, 2014-2015 Administration (WIDA Consortium Annual Technical Report No. 11).

## Other Documentation

Bachman, L. F. (2005). Building and supporting a case for test use. Language Assessment Quarterly, 2(1), 1-34.

This article describes how an argument for test use might be structured so as to provide a clear linkage from test performance to interpretations and from interpretations to uses.

Bachman, L. F., \& Palmer, A. S. (2010). Language assessment in practice. Oxford: Oxford University Press.

This book presents the Assessment Use Argument, which provides a framework for justifying the intended uses of an assessment, as well as a guide for the design and development of the assessment itself.

Bauman, J., Boals, T., Cranley, E., Gottlieb, M., \& Kenyon, D. M. (2007). The Newly Developed English Language Tests (World-Class Instructional Design and Assessment - WIDA). In J. Abedi (Ed.), English Language Proficiency Assessment in the Nation: Current Status and Future Practice. Davis: University of California.

In this book chapter, the authors describe the test development process, from the development of standards through the development of items, field testing, and operationalization. They also report on validation of the test, accommodations, the test administration and technical manuals, and score reporting.

Chapelle, C. A., Enright, M.K. \& Jamieson, J. (Eds.) (2008). Building a validity argument for the Test of English as a Foreign Language. London: Routledge.

This book uses the Test of English as a Foreign Language ${ }^{\text {TM }}$ as a case study for validating test design. It attempts to meet the standards of educational measurement while also drawing on theory related to English language proficiency.

Chapelle, C. A., Enright, M. K., \& Jamieson, J. (2010). Does an argument-based approach to validity make a difference? Educational Measurement: Issues and Practice, 29(1), 313.

Drawing on experience between 2000 and 2007 in developing a validity argument for the high-stakes Test of English as a Foreign Language ${ }^{\text {TM }}$, this paper evaluates the differences between the argument-based approach to validity as presented by Kane (2006) and that described in the 1999 AERA/APA/NCME Standards for Educational and Psychological Testing.

Cook, H. G. (2007). Alignment Study Report: The WIDA Consortium's English Language Proficiency Standards for English Language Learners in Kindergarten through Grade 12 to ACCESS for ELLs ${ }^{\circledR}$ Assessment. Madison, WI: WIDA Consortium.

In this report, the author describes a study to align the WIDA Standards to the ACCESS for ELLs test. The study was designed to address two questions: how well the test measures the proficiency levels described in the Standards, and how well the different domains of each standard are addressed by the domains of the test. The author concludes that overall ACCESS for ELLs is adequately aligned to the Standards.

Cook, H. G., Boals, T., Wilmes, C., \& Santos, M. (2007). Issues in the Development of Annual Measurable Achievement Objectives (AMAOs) for WIDA Consortium States. Madison, WI: WIDA Consortium.

In this paper, the authors offer guidance to states in formulating Annual Measurable Achievement Objectives for English language learners.

Fox, J. \& Fairbairn, S. (2011). Test review: ACCESS for ELLs®. Language Testing, 28 (3): 425-431.

The author provides a thorough review of ACCESS for ELLs, using the eight criteria enumerated in Fairbairn and Fox (2009).

Gottlieb, M. (2004). English Language Proficiency Standards for English Language Learners in Kindergarten through Grade 12: Framework for Large-Scale State and Classroom Assessment. Madison, WI: WIDA Consortium.

These documents contain the WIDA Standards and describe the rationale behind and development of the frameworks for large-scale state and classroom assessments. These frameworks comprise English Language Development standards, language domains, grade-level clusters, language proficiency levels and the model performance indicators upon which ACCESS for ELLs is based. They are meant to guide curriculum development, instruction, and assessment of English language learners.

Kane, M. (2006). Validation. In R. Brennan, (Ed.), Educational Measurement (4 ${ }^{\text {th }}$ Edition) (pp. 18-64). Westport, CT: Greenwood Publishing.

This book chapter presents a conceptualization of test validity where evidence and logical argument are brought together to evaluate claims and propositions about the proposed uses and interpretations of test results.

Kenyon, D. M., MacGregor, D., Li, D., \& Cook, H. G. (2011). Issues in vertical scaling of a K12 English language proficiency test. Language Testing, 28 (3): 383-400.

In this article, the authors describe the procedure used to place ACCESS for ELLs results on a vertical scale, and they discuss studies conducted to test the effectiveness of that scale.

Mislevy, R. J., Almond, R. G., \& Lukas, J. F. (2004). A Brief Introduction to Evidence-Centered Design (CSE Report 632). CA: Center for Research on Evaluation, Standards, and Student Testing.

This paper provides an introduction to the basic ideas of Evidence-Centered Design, an approach to constructing educational assessments in terms of evidentiary arguments. It includes some of the terminology and models that have been developed to implement the approach.

National Research Council. (2011). Allocating federal funds for state programs for English language learners. Washington, DC: The National Academies Press.

This report includes detailed descriptions of six English language proficiency tests, including ACCESS for ELLs, along with information about the reliability and validity of the tests.

Parker, C. E., Louie, J., \& O’Dwyer, L. (2009). New measures of English language proficiency and their relationship to performance on large-scale content assessments (Issues \& Answers Report, REL 2009-No. 066). Washington, DC: U.S. Department of Education, Institute of Education Sciences, National Center for Education Evaluation and Regional Assistance, Regional Educational Laboratory Northeast and Islands. Retrieved from http://ies.ed.gov/ncee/edlabs, January 29, 2009.

This report describes a study investigating how well the domain tests on ACCESS for ELLs predict performance on a content test. Results indicate that the Reading and Writing tests are the strongest predictors.

Römhild, A., Kenyon, D. M., \& MacGregor, D. (2011). Exploring domain-general and domainspecific linguistic knowledge in the assessment of academic English language proficiency. Language Assessment Quarterly, 8, 213-228.

This article reports on a confirmatory factor analysis study conducted to model domain-specific and domain-general variance on ACCESS for ELLs. The authors found that, while domain-general linguistic knowledge represents the primary dimension across almost all test forms, domain-specific knowledge becomes increasingly salient as proficiency level increases.

WIDA Consortium. (2007). English Language Proficiency Standards and Resource Guide, 2007 Edition, PreKindergarten through Grade 12. Madison, Wisconsin: Board of Regents of the University of Wisconsin System.

This document presents the second edition of the WIDA English Language Development Standards, which were released in 2007. The second edition included the addition of formative and summative frameworks for assessment and instruction, the separation of Kindergarten into its own grade-level cluster, and the addition of the sixth proficiency level, "Reaching."

WIDA Consortium. (2012). 2012 Amplification of the English Language Development Standards Kindergarten-Grade 12. Madison, Wisconsin: Board of Regents of the University of Wisconsin System.

This document describes the amplified Strands of Model Performance Indicators that represent the WIDA English Language Development Standards. The amplification reflects states' content standards and the fluid and ongoing process of language development.

WIDA Consortium. (2013). Interpretive Guide for Score Reports Spring 2013 (WIDA Consortium). Madison, WI: The Board of Regents of the University of Wisconsin System.

This report provides an overview on how ACCESS for ELLs is scored and how those scores are reported. Part 1 gives a description of scores for 2014. Part 2 gives suggestions on how states can use scores, as well as examples of score reports to various stakeholders. Part 3 provides guidance on interpreting the reports.

## 1. Description of ACCESS for ELLs English Language Proficiency Test

### 1.1 Purpose of ACCESS for ELLs

The overarching purpose of ACCESS for ELLs 2.0 is to assess the developing English language proficiency of English language learners (ELLs) in Grades K-12 in the United States as defined by the multi-state WIDA Consortium, first in the English Language Proficiency Standards (Gottlieb, 2004; WIDA Consortium, 2007), then in the amplified 2012 English Language Development (ELD) Standards (WIDA Consortium, 2012). The WIDA ELD Standards, which correspond to the academic language identified in state academic content standards, describe six levels of developing English language proficiency and form the core of the WIDA Consortium's approach to instructing and testing ELLs. ACCESS 2.0 may thus be described as a standardsbased English language proficiency test designed to measure the social and academic language proficiency of ELLs in English. It assesses social and instructional English as well as the academic language associated with language arts, mathematics, science, and social studies within the school context across the four language domains (Listening, Reading, Writing, and Speaking).

Other major purposes of ACCESS 2.0 include:

- Identifying the English language proficiency level of students with respect to the WIDA ELD Standards used in all member states of the WIDA Consortium,
- Identifying students who have attained English language proficiency,
- Assessing annual English language proficiency gains using a standards-based assessment instrument,
- Providing districts with information that will help them to evaluate the effectiveness of their language instructional educational programs and determine staffing requirements,
- Providing data for meeting federal and state statutory requirements with respect to student assessment, and
- Providing information that enhances instruction and learning in programs for English language learners.

ACCESS 2.0 is offered in two formats: ACCESS 2.0 Paper, described in this report, and ACCESS 2.0 Online, described in a companion report.

### 1.2 Format of ACCESS 2.0 Paper

### 1.2.1 Integration with the Standards

The original ACCESS test design, from the structure of the assessment system to the content of each test booklet and item, is built upon the five foundational WIDA ELD Standards:

Standard 1: ELLs communicate in English for Social and Instructional purposes within the school setting.

Standard 2: ELLs communicate information, ideas, and concepts necessary for academic success in the content area of Language Arts.

Standard 3: ELLs communicate information, ideas, and concepts necessary for academic success in the content area of Mathematics.

Standard 4: ELLs communicate information, ideas, and concepts necessary for academic success in the content area of Science.

Standard 5: ELLs communicate information, ideas, and concepts necessary for academic success in the content area of Social Studies.

For practical purposes, the five Standards are abbreviated as follows in this report:

- Social and Instructional language: SIL
- Language of English Language Arts: LoLA
- Language of Math: LoMA
- Language of Science: LoSC
- Language of Social Studies: LoSS

Every selected response item and every performance-based task on ACCESS for ELLs targets at least one of these five Standards. In the case of some test items and tasks, the standards are combined as follows:

- Integrated Language of Science (LoSC), Language of Language Arts (LoLA), and Language of Social Studies (LoSS): IT
- Language of Math (LoMA) and Language of Science (LoSC): MS
- Language of English Language Arts (LoLA) and Language of Social Studies (LoSS): LS

### 1.2.2 Grade-Level Clusters

The grade-level cluster structure for ACCESS 2.0 Paper is as follows: K, 1, 2, 3, 4-5, 6-8, 9-12. In the lower grades (grades $1-5$ ), test forms may be shared across grade-level clusters. As described in Sections 1.3.3 and 1.3.4 below, the development of the Listening and Reading tests was conducted as part of ACCESS 1.0, which has a cluster structure that differs from that of

ACCESS 2.0 in the lower grades. The Speaking and Writing tests were developed using the ACCESS 2.0 Online cluster structure. ACCESS 2.0 Paper clusters, therefore, bridge the cluster structure of ACCESS 1.0 and ACCESS 2.0 Online. For example, the Cluster 2 tests in the domains of Reading and Listening are the same test forms as the Cluster 1 tests. The Cluster 2 tests in the domains of Speaking and Writing are the same test forms as the Cluster 3 tests in these domains. Table 1.2.2A details the grade-level cluster structure of ACCESS2.0 Paper and the shared forms across clusters.

Table 1.2.2A
ACCESS 2.0 Paper Grade-level Clusters and Shared Forms Across Clusters

| ACCESS 2.0 Paper Grade-level Clusters | Shared Test Forms (Listening and Reading) | Shared Test Forms (Speaking and Writing) | Grade |
| :---: | :---: | :---: | :---: |
| K | K | K | K |
| 1 | Cluster 1 and Cluster 2 | Cluster 1 | 1 |
| 2 |  | Cluster 2 and Cluster 3 | 2 |
| 3 | Cluster 3 and Cluster 4-5 |  | 3 |
| 4-5 |  | Cluster 4-5 | 4 |
|  |  |  | 5 |
| 6-8 | Cluster 6-8 | Cluster 6-8 | 6 |
|  |  |  | 7 |
|  |  |  | 8 |
| 9-12 | Cluster 9-12 | Cluster 9-12 | 9 |
|  |  |  | 10 |
|  |  |  | 11 |
|  |  |  | 12 |

### 1.2.3 Language Domains

The WIDA ELD Standards describe developing English language proficiency for each of the four language domains: Listening, Reading, Writing, and Speaking. Thus, ACCESS 2.0 Paper contains four sections, each assessing an individual language domain.

### 1.2.4 Language Proficiency Levels

The WIDA ELD Standards document fully delineates the continuum of language development via five language proficiency levels (PLs) that are fully delineated in the WIDA ELD Standards document (WIDA, 2012), with scores indicating progression through each level. These levels are Entering, Emerging, Developing, Expanding, and Bridging. There is also a final stage known as Reaching, which is used to describe students who have progressed across the entire WIDA English language proficiency continuum; as such, scores do not indicate progression through this level. The proficiency levels are shown graphically in Figure 1.2.4A.

Figure 1.2.4A. The language proficiency levels of the WIDA ELD Standards.
These language proficiency levels are embedded in the WIDA ELD Standards in a two-pronged fashion.

First, they appear in the performance definitions. According to the WIDA ELD Standards, the performance definitions provide a global overview of the stages of the language acquisition process. As such, they complement the model performance indicators (MPIs; see below) for each language proficiency level. The performance definitions are based on three criteria: (a) vocabulary usage at the word/phrase level; (b) language forms and conventions at the sentence level; and (c) linguistic complexity at the discourse level. Vocabulary usage refers to students' increasing comprehension and production of the technical language required for success in the academic content areas. Language forms and conventions refers to the increasing development of phonological, syntactic, and semantic understanding in receptive skills or control of usage in productive language skills. Linguistic complexity refers to students' demonstration of oral interaction or writing of increasing quantity and variety.

Second, the language proficiency levels of the WIDA ELD Standards are fully embedded in the accompanying MPIs, which exemplify the Standards. The MPIs describe the expectations for ELL students in each of the five Standards, at five ${ }^{1}$ different grade-level clusters, across the four

[^0]language domains. That is, an MPI at each of the five language proficiency levels can be found within each combination of Standard, grade-level cluster, and language. Reaching (PL 6), represents the end of the continuum rather than another level of language proficiency. The sequence of these five MPIs together describes a logical progression and accumulation of skills on the path from the lowest level of English language proficiency to full English language proficiency for academic success. The grouping of five MPIs in logical progression is called a "strand."

ACCESS 2.0 is based on individual MPIs organized into strands within the WIDA ELD Standards. ${ }^{2}$ Each selected-response item or performance-based task on ACCESS for ELLs is carefully developed, reviewed, piloted, and field tested to ensure that it allows students to demonstrate accomplishment of the targeted MPI.

### 1.2.5 Tiers

Tests must be at the appropriate difficulty level for individual test takers in order to be valid and reliable. As one might expect, test items and tasks that allow Entering (PL 1) or Emerging (PL 2) students to demonstrate accomplishment of the MPIs at their proficiency level will not allow Expanding (PL 4) or Bridging (PL 5) students to demonstrate the full extent of their language proficiency. Likewise, items and tasks that allow Expanding (PL 4) and Bridging (PL 5) students to demonstrate accomplishment of the MPIs at their level would be far too challenging for Entering (PL 1) or Emerging (PL 2) students. Items that are far too easy for test takers may be boring and lead to inattentiveness on the part of students; items that are far too difficult for test takers may be frustrating and discourage them from performing their best. But more importantly, items that are too easy or too hard for a student add very little to the accuracy or quality of the measurement of that student's language proficiency.
In order to make ACCESS 2.0 appropriate to the proficiency level of individual students across the wide range of proficiencies described in the WIDA ELD Standards, the solution is to present the test items in three overlapping tiers (A, B, and C) for each grade-level cluster. Figure 1.2.5A shows how the different tiers map to the language proficiency levels.

[^1]

Figure 1.2.5.A.2.5A. Tier structure of ACCESS for ELLs

Each grade 1-12 test-taker takes either the Tier A, Tier B, or Tier C form of the assessment. The Kindergarten assessment is not tiered.

In ACCESS 2.0 Paper, the Listening and Reading tests have three forms (that is, one at each tier) for each grade-level cluster. Tier A has items and tasks designed to allow students at the lowest language proficiency levels (PLs 1 and 2) to meet the WIDA ELD Standards at their language proficiency levels, and it includes some items targeted to Level 3. Likewise, Tier C has items and tasks designed to allow students at the highest language proficiency levels (PLs 4 and 5) to meet the WIDA ELD Standards at their language proficiency levels, while also containing some items targeted to Level 3. (Note that, in order to assure that students are accurately measured to PL 6, Tier C also includes some items that are slightly more difficult than PL 5 items.) In this test design, the tiers overlap: while Tier A and Tier C have little in common, Tier B is composed of tasks from both Tiers A (PL 2) and C (PL 4), as well as tasks from PL 3. This overlap of tiers ensures that all of the proficiency levels are assessed across the assessment as a whole; however,
each test booklet need not contain an unduly large number of test items. The overlap also ensures that the entire language proficiency range is covered. Thus, a test booklet at any given tier is primarily composed of items and tasks that span three targeted language proficiency levels.

In the domains of Writing and Speaking, for each grade-level cluster, there are two forms: a Tier A form, and a shared Tier B and Tier C form. The Tier A form of the Writing test has items targeting PLs 1,2 , and 3 . The Writing test form that is shared by Tier B and Tier C has items targeting PLs 4 and 5. The Tier A form of the Speaking test has item targeting PLs 1 and 3, and the test form that is shared by Tier B and Tier C has items targeting PLs 3 and 5.

### 1.3 Test Development

Development of ACCESS 2.0 Series 400 Paper marked the transition point from the original ACCESS testing program, which was entirely paper-based, to the launch of ACCESS 2.0, which is offered both in Online and Paper formats. Development for ACCESS 2.0 Series 400 Paper reflects this transition. The Listening and Reading tests for ACCESS 2.0 Series 400 Paper were developed under the framework of ACCESS, while the Writing and Speaking tests were developed under the ACCESS 2.0 framework. The general process of item writing and editing, and of item content bias and sensitivity reviews, is similar from ACCESS to ACCESS 2.0; these processes are described in the sections below and apply to all four domains of the test. Details are also provided on the development of the Listening and Reading tests and then on development of the Writing and Speaking tests. Finally, we provide a brief overview of the development of the Kindergarten test.

### 1.3.1 Item Writing and Editing

Initial item writing is done by participants in an online item writing course or item writing workshop conducted by the Center for Applied Linguistics (CAL). Then, the items generated are reviewed internally and selected for further development based on how well they fit the Standards and MPIs, and how different they are in terms of content from the previous year's items. The chosen items are refined by CAL staff before undergoing item content and bias and sensitivity reviews.

### 1.3.2 Item Content and Bias and Sensitivity Reviews

After items are internally refined, they are reviewed by two panels: a content review panel and a bias and sensitivity review panel. The panels consist of educators from WIDA Consortium states. Items are submitted to the content review panel to assure that the content is accessible and relevant to students in the targeted grade-level cluster, and that each item or task matches the MPI from the WIDA ELD Standards that it is intended to assess. The bias and sensitivity review panel inspects the items for potential bias that may unfairly disadvantage some students over others. Bias and sensitivity panelists represent a variety of language backgrounds and ethnicities. Based on their recommendations, the items are revised as necessary.

### 1.3.3 Development of Listening and Reading

The Listening and Reading components of ACCESS 2.0 Series 400 Paper were created during the original ACCESS development cycle. ACCESS was first field tested in 2004, and from 2004-2014, development continued for ACCESS, culminating in Series 303, operational in 2014-2015. For further detail on this original field test and on the processes for ongoing item development from 2004-2014, see the ACCESS for ELLs Technical Reports, particularly ACCESS for ELLs Technical Report No. 1, Development and Field Test of ACCESS for ELLs (2006) and ACCESS for ELLs Technical Report No. 11 (2016).

The Listening and Reading tests for ACCESS 2.0 Series 400 Paper are composed of the same sets of items, across all grade-level clusters and tiers, as ACCESS Series 302, with minor exceptions. First, the grade-level cluster structure was updated for ACCESS 2.0. Second, there are two Reading test forms in which items are not the same between Series 302 and Series 400 Paper. In the form shared across Clusters 1 and 2 (Tier C), three items from the Series 302 form were substituted with three items from Series 203 to produce the Series 400 form. This substitution was made to avoid having very similar text appear in the key for different items on the same test form. Likewise, in the form shared across Clusters 3 and 4-5 (Tier B), three items from the Series 302 form were substituted with three items from Series 203 to produce the Series 400 form. This substitution was made to avoid a potential sensitivity issue in the wake of 2015 current events.

### 1.3.4 Development of Writing and Speaking

The Writing and Speaking tests for ACCESS 2.0 Series 400 Paper were developed to be shared across the Online and Paper versions of ACCESS 2.0 and followed the usual development cycle. In other words, the Online and Paper versions of the tests have the same tasks, by grade-level cluster and tier, with minor exceptions. In Writing, there are some differences in presentation between the Online and Paper test which results form the mode difference. In addition, the Paper test does not include the Speaking tier pre-A, which is included on the Online test. ${ }^{3}$ Second, the Paper test maintains the tier structure of ACCESS for ELLs 1.0, which was provided in three tiers (A, B, and C), in order to accomodate the tier structure of Listening and Reading. Writing and Speaking tasks, however, were developed for ACCESS for ELLs 2.0 Online, which has two tiers in these domains ( A and $\mathrm{B} / \mathrm{C}$ ). To bridge the structure of ACCESS for ELLs 1.0 and ACCESS for ELLs 2.0 Online, the same test form is shared across Tier B and Tier C Writing and Speaking tests. Table 1.3.2.A provides a graphic representation of this tier structure.

[^2]Table 1.3.2A
ACCESS 2.0 Paper Tier Structure and Shared Forms Across Tiers in Writing and Speaking

| Domain | Tier | Shared forms |
| :--- | :--- | :--- |
| Writing | A | A |
|  | B | B and C are shared |
|  | C |  |
| Speaking | A | B and C are shared |
|  | B |  |

### 1.3.4.1 Development of Tasks

For Writing tasks, after the external bias, sensitivity and content reviews, tasks are subject to two rounds of small-scale tryouts, the first led by CAL and the second by teachers in the field. In these tryouts, candidate folders are administered to students; student responses, as well as observations and interviews, inform further revisions to the folders. A small-scale field test of Writing folders is conducted, with responses scored at CAL, followed by a qualitative analysis of the collected responses. The main purpose of this small-scale field testing is to confirm that the tasks are functioning as intended, identify benchmark samples for rater training, and inform the rating of the tasks when they become operational.

The development of Speaking tasks is similar to that of Writing, but, as with Listening and Reading, all Speaking tasks undergo large-scale field testing. Thus, Speaking tasks undergo both quantitative and qualitative analyses following the field test to determine their appropriateness for inclusion in the next year's operational test.

### 1.3.4.2 Equipercentile Linking

In order to link the new ACCESS 2.0 scoring scales in Writing and Speaking to the ACCESS for ELLs 1.0 scoring scale, an equipercentile linking study was conducted in the spring of 2016. This method maintains the distribution of scale scores across two assessments by assigning scale scores to students based on their percentile ranking in the assessment.

The ACCESS 2.0 Series 400 Writing and Speaking tests were designed to measure the same constructs and had the same specifications as ACCESS 1.0 Series 303. However, several changes were made to the Series 400 Writing and Speaking scoring scales and scoring procedures such that the reporting scales cannot be adequately maintained through traditional scaling procedures (Mislevy, 1992). An equipercentile linking study (Kolen \& Brennan, 2004) was conducted to link the Series 400 and Series 303 Writing and Speaking scale scores in order to maintain the ACCESS Writing and Speaking score distribution. The linking study adapted a process for
concordance that was proposed by Pommerich, Hanson, Harris, and Sconing (2004) and seen in Pommerich (2007). The main analysis involves linking the scale score distribution of Series 400 early return data to those of Series 303 population data. The computer software program LEGS (Linking with Equivalent Groups or Single Group Design) (Brennan, 2004a) was used in conducting the linking.

The Series 303 Writing test had three tiers (A, B, C) while the Series 400 Writing test combines Tiers B and C, therefore the Writing linking analysis was conducted by the Series 400 grade and tiers ( $\mathrm{A}, \mathrm{B} / \mathrm{C}$ ) so that the data being linked between two administrations would be comparable. To obtain Series 400 Writing scale score distribution for the early return data, student measures were derived using the field test parameters and transformed to the ACCESS scale score metric. During the ACCESS 2.0 Series 400 Writing field test, students took field test tasks after taking the operational ACCESS test. For the field test analysis, Writing field test tasks and rating scale parameters were estimated while anchoring on ACCESS Writing task parameters. These field test parameters were used to establish a temporary scale for conducting the equipercentile linking between series. Because the Series 303 test utilized separate Tier B and Tier C forms, population writing data from these tiers were first combined and then used in the equipercentile analyses. After the linking analyses were completed, each Series 400 scale score could be linked to a Series 303 equated scale score. Series 303 Tier B scale scores were used in creating the link. Then raw score to scale score tables were created by grade and tier. Finally, the conditional standard errors of measurement for the Series 303 equated scale scores were used to report out the conditional errors of measurement for Series 400 scale scores.

Since the Series 303 Speaking test was not tiered while the Series 400 Speaking test has three tiers (Pre-A, A, B/C), Speaking linking analyses were conducted by grade across Series 400 tiers. To obtain Series 400 Speaking scale score distribution for the early return data, a Rasch calibration was first conducted by grade, which puts task and person measure on the same logit scale by grade. Student measures were then derived and transformed to a temporary scale score metric and used in the equipercentile analyses. After the linking analyses were completed, each Series 400 scale score could be linked to a Series 303 (equated) scale score. Then raw score to scale score tables were created by grade and tier. Essentially, the raw score range of each Series 303 grade-level cluster test was separated into three sections, one for each Series 400 tiers.
Because the Series 303 grade-level cluster raw score range is relatively short ( $0-13$ ), not all of the proficiency levels are covered at the Series 400 grade and tier level. However, all proficiency levels are covered at the Series 400 grade-level cluster level. Finally, the conditional standard errors of measurement for the Series 303 equated scale scores were used to report out the conditional errors of measurement for Series 400 scale scores.

Since the goal of the equipercentile procedure is to preserve the scale score distribution of the ACCESS Series 303 Speaking and Writing test, the proportion of students at each observable scale score and WIDA proficiency level is constrained to be more or less the same between
series at the level where the linking was conducted. Such an approach provides stability for the ACCESS 2.0 Series 400 Writing and Speaking scores.

### 1.3.5 Development of Kindergarten Test

A separate field test was conducted for the Kindergarten test in 2008 in Washington, D.C. The final version of the adaptive Kindergarten assessment was produced by first choosing the Listening and Reading folders (i.e., sets of thematically-related items) that contained items that were empirically the easiest for first graders based on the data collected from the field test. These folders were ordered from easiest to hardest on the Kindergarten assessment. The Writing portion of the Kindergarten assessment included very simple writing tasks that were adapted from the SIL Writing folder on the original ACCESS Cluster 1-2 Tier A test form. The Speaking portion of the Kindergarten assessment was the same as that of the original ACCESS Cluster 1-2 test form, except it included only SIL and LoLA/LoSS folders, in order to reduce testing time.

The adaptive administration of the Kindergarten assessment includes stopping rules. In any domain, if a student does not get at least two items in any folder correct, the administrator stops testing in that domain and moves on to the next domain.

A total of 154 students participated in the Kindergarten field test. Of those, $55 \%$ were boys ( 84 students) and $45 \%$ were girls ( 70 students). Spanish speakers comprised $90.2 \%$ (139) of the sample; the only other language with more than one student was Vietnamese (3).

### 1.3.6 Reporting Scale

ACCESS has a vertically-equated scale (i.e., one that can measure progress across the grade levels from K to 12 ), as well as being horizontally equated across tiers within each grade-level cluster.

The scale runs from 100 to 600 scale score points. The scale has an interpretive center point across domains and composites. The centering value is 350 , which represents, for original ACCESS, the cut score between PLs 3 and 4 for grade 5. The scale has a lower bound of 100 (i.e., 250 points lower than the center of 350 ) and an upper bound of 600 (i.e., 250 points higher than 350). In other words, conceptually, students from Grades $\mathrm{K}-2$ with the lowest language proficiency in any domain can go no lower than a scale score of 100 while students from Cluster $9-12$ with the highest language proficiency in any domain can go no higher than 600 . Observed scores on all tests must fall between these extremes.

It should be noted that a scale score is an interpretation of a latent ability measure and not a record of "points" earned on the test. In other words, 100 does not necessarily represent a score of 0 at all grade-level clusters, nor does 600 represent a perfect score. In fact, due to the technical nature of a vertical scale, as one moves from grade to grade, the scale adjusts for developmental growth. Thus, even if a student consistently receives a score of 0 while moving from grade-level cluster to grade-level cluster, the student's scale score on a vertical scale would show an increase, even if very slight.

Thus, to interpret appropriately the meaning of the scale score, a standard-setting study was conducted, which is discussed in Section 1.3.7. We focus on the creation of the ACCESS for ELLs scale score here.

For details on the initial development of the ACCESS score scale, conducted subsequent to the first field test administration, see ACCESS for ELLs Technical Report No. 1, Development and Field Test of ACCESS for ELLs (2006), as well as Kenyon, MacGregor, Li, and Cook (2011).

Throughout the duration of ACCESS for ELLs 1.0, annual equating procedures were conducted to ensure that test results were reported on a consistent scale, year-to-year. This annual equating is the process used to maintain the ACCESS score scale.

The reporting scale for ACCESS 2.0 Series 400 maintains the same scale as ACCESS. The logit scale is transformed into a reporting scale by means of a linear transformation of the logit scores. There is a separate scale, and hence a separate transformation constant, for each of the four domains: Listening, Reading, Writing, and Speaking. For Series 400, the linear transformation of logit scores was used to generate scale scores for Listening and Reading only.

### 1.3.7 Standard Setting

In order to interpret appropriately what the ACCESS scale scores meant, a standard setting study was conducted in Madison, Wisconsin between April 20-27, 2005. The purpose of the study was not to set new standards, per se; rather, it was to use the WIDA ELD ${ }^{4}$ Standards together with empirical information from the field test data to conduct a defensible and replicable approach to determining the relationship between student performances on the four domains of ACCESS and the language proficiency levels defined by the WIDA ELD Standards. Following is a brief summary of the Standard Setting Study. For a fuller description, see ACCESS for ELLs Technical Report No. 1, Development and Field Test of ACCESS for ELLs (2006).

Four panels were convened, one for each grade-level cluster: 1-2, 3-5, 6-8, and 9-12. There were 20-22 teachers or school administrators on each panel who were deemed qualified by WIDA to participate in the study. For Listening and Reading, a bookmarking procedure was used. Panelists were given books with all items within their grade-level cluster arranged by empirical difficulty, from least difficult to most difficult. After discussing the MPIs and the performance level descriptions from the WIDA ELD Standards, panelists were asked to work independently, reading through the items and bookmarking the item that they determined a student at PL 1 would have a $50 \%$ chance of answering correctly. They were then asked to repeat this procedure for all levels up to PL 5.

[^3]After the initial round of bookmarking, the results were compiled and discussed with the panelists as a group. The panelists were then given the opportunity to reconsider and adjust their bookmarking, if desired. These results were compiled and presented to the WIDA management team, who used this data to help determine the final cut scores.

For Writing and Speaking, a modified body-of-work method was used. For Writing, the panelists were presented a book of portfolios from their grade-level cluster. Each portfolio consisted of the written responses from a single student's test. For Speaking, student portfolios consisted of audio-recorded spoken responses. Student portfolios were selected from each tier, and an attempt was made to select students whose performances did not vary widely from one task to another. Within each grade-level cluster, portfolios were presented in ascending order; that is, the first portfolio represented student work that had received the lowest total raw score across responses, and the last portfolio represented student work with a very high total raw score across responses. After discussing the MPIs and the performance level descriptions as a group, the panelists were asked to read through the Writing portfolios or listen to the Speaking portfolios and, working independently, make a judgment as to the probability that the responses represented a student at a given language proficiency level. For example, if they felt the portfolio represented the work of a student at PL 3, they would write $100 \%$ under the column " 3 " on their paper. If they felt that it was a borderline performance between PLs 2 and 3 , they would write $50 \%$ under " 2 " and $50 \%$ under " 3 ." They were allowed to indicate up to two language proficiency levels with a range in 10 -point increments (i.e., $50 / 50,60 / 40,70 / 30,80 / 20$, or $90 / 10$ ), or to indicate 100 under one language proficiency level. The results were compiled and discussed with the panelists as a group. The panelists were then given the opportunity to reconsider and adjust their judgments, if desired.

The final results were analyzed by CAL using a logistic regression procedure to determine the points along the underlying proficiency continuum at which at least $50 \%$ of the panelists would be expected to agree that the responses would represent the work of the next higher proficiency level. The results from this analysis were used to set the cut scores for the language proficiency levels for Writing and Speaking.

### 1.4 Reporting of Results

### 1.4.1 Scale Scores

ACCESS scores are reported as both scale scores and proficiency level scores. Scale scores, ranging from 100 to 600, are given for all four language domains. In addition, four composite scores, also ranging from 100 to 600, are given: Oral Language, Literacy, Comprehension, and Overall Composite.

The four composite scores are calculated using the following scale score weighting scheme:

- Oral Language (50\% Listening + 50\% Speaking)
- Literacy ( $50 \%$ Reading $+50 \%$ Writing)
- Comprehension ( $30 \%$ Listening $+70 \%$ Reading)
- Overall Composite ( $15 \%$ Listening $+15 \%$ Speaking $+35 \%$ Reading $+35 \%$ Writing)

Figure 1.5.1A depicts the weighting for each of the composite scores. As shown, the Overall Composite is computed using scores from all four domains. Each of the other three composites is shown with the weighting of domains, in terms of the weighting used for the Overall Composite. As the diagram shows, more weighting is given to the literacy skills than to the oral skills for the Overall Composite. This weighting resulted from a policy decision by the WIDA Board before the first operational administration of ACCESS, based on the view that literacy skills are paramount in developing academic language proficiency.

Figure 1.5.1A. Domain Composites

### 1.4.2 Language Proficiency Level Scores

In addition to the ACCESS scale scores, test score users also receive proficiency level scores. These scores are interpretive; that is, they interpret a student's scale score in terms of the results of the standard setting study. The cut scores between proficiency levels are presented in Tables
$1.4 .2 \mathrm{~A}-\mathrm{H}$ and reflect the adoption of the grade-level cut scores for Series 102 and beyond, as well as the Instructional and Accountability cut scores adapted for Kindergarten for Series 200 and beyond.

| 3 | Over | 272 | 303 | 328 | 347 | 369 |
| 4 | Over | 283 | 314 | 340 | 359 | 380 |
| 5 | Over | 293 | 324 | 350 | 369 | 390 |
| 6 | Over | 302 | 334 | 359 | 379 | 399 |
| 7 | Over | 311 | 342 | 368 | 386 | 407 |
| 8 | Over | 319 | 350 | 375 | 394 | 414 |
| 9 | Over | 327 | 357 | 382 | 400 | 419 |
| 10 | Over | 333 | 363 | 387 | 405 | 424 |
| 11 | Over | 340 | 368 | 391 | 409 | 427 |
| 12 | Over | 346 | 372 | 395 | 413 | 430 |

A proficiency level score consists of a two-digit decimal number (e.g., 4.5). The first digit represents the student's overall language proficiency level range based on the student's scale score. A score of 4.5 indicates that the student is in PL 4. The number to the right of the decimal is an indication of the proportion of the range between cut scores that the student's scale score represents. A score of 4.5 tells us that the student's scale score is halfway between the cut scores for Levels 4 and 5.

Unlike the scale scores, which form an interval scale and are continuous across the grades from Kindergarten to Grade 12, proficiency level scores are dependent upon which grade a student was in when ACCESS was administered. See, for example, the Listening cut scores in Table 1.5.2A. If a Grade 2 student receives a 350 in Listening, that would be a PL score of 6.0 ; if a Grade 5 student receives a 350 in Listening, that would be a 4.0 ; if a Grade 8 student receives a 350 in Listening, that would be a 3.2; and if a Grade 12 student receives a 350 in Listening, it would be a 2.3.

Because the bands between cut scores vary in width, proficiency level scores should not be considered to form an interval scale. That is, the distance between PL scores 1.5 and 2.5 cannot be assumed to be equal to the distance between PL scores 2.5 and 3.5. Only scale scores should be used as interval measures. Proficiency level scores are interval within a grade and proficiency level (e.g., in Grade 3, the distance between 3.1 and 3.2 is the same as the distance between 3.7 and 3.8), but they do not form an interval scale across proficiency levels.

### 1.5 Test Administration

### 1.5.1 Test Administrator Training

To prepare individuals to serve as test administrators, test administrator training for ACCESS 2.0 Series 400 Paper was conducted through an online course hosted on WIDA's website. Three certifications were offered to participants: a group test administration certification pertaining to the Listening, Reading, and Writing portions of ACCESS 2.0; a certification for the Speaking test; and a certification for the Kindergarten test. In order to be certified to administer the Listening, Reading, and Writing portions, participants had to complete and mark off tasks listed on a test administrator checklist. In order to be certified to administer the Speaking test and the Kindergarten test, participants had to pass a quiz after completing the course.

### 1.5.2 Test Security

Every effort is made to keep the test secure at all levels of development and administration. WIDA, CAL, and Data Recognition Corporation (DRC, the entity responsible for distribution, collection, and scoring of the printed tests) follow established policies and procedures regarding the security of the test, and every individual involved in the administration of ACCESS 2.0, from the district level to the classroom level, is trained in issues of test security.

### 1.5.3 Test Accommodations

If a test taker has an Individualized Education Plan (IEP), to the extent possible, the recommendations in the student's IEP are to be followed. The extent to which this was accomplished for ACCESS 2.0 Series 400 Paper was a local decision made during administration.

Starting with the 2011-2012 testing cycle, WIDA made available the Alternate ACCESS for ELLs test (hereafter, Alternate ACCESS). Alternate ACCESS is intended only for ELLs who
have cognitive disabilities ${ }^{5}$ that are so significant as to prevent meaningful participation in ACCESS testing, even with accommodations. The results of the Alternate ACCESS operational administration will appear in a separate technical report.

### 1.6 Scoring

Test booklets are returned to DRC after testing, where they are electronically scanned in preparation for scoring. Listening, Reading, and Writing are scored by DRC. Speaking is locally scored by the test administrator. Details of the scoring methods are described below.

### 1.6.1 Listening and Reading

In the case of the Listening and Reading tests, all items are selected-response and thus are dichotomously scored as correct or incorrect. Students mark their answers directly in their test booklets, so each page is scanned into an electronic database.

### 1.6.2 Writing

Student responses to the Writing tasks are centrally scored at DRC. The ACCESS 2.0 Writing Scoring Scale is distinct from the WIDA Writing Rubric, which is a tool for evaluating student writing in classrooms and for interpreting student scores from ACCESS 2.0. The Writing Scoring Scale, however, was designed specifically as a scoring tool only and is not appropriate for any other purposes.

The ACCESS 2.0 Writing Scoring Scale has six whole score points that range from 1 through 6. For responses that fall in between the whole score points, plus score points are available. The scale descriptors include three different yet interrelated dimensions: discourse, sentence and word/phrase. The scale descriptors guide raters as they consider all three dimensions in order to make holistic judgments about which score points best suit a response. The dimensions are distinguished as follows:

- The discourse descriptors focus on the degree of organization and the extent to which the response is tailored to the context (e.g., purpose, situation and audience).
- The sentence descriptors describe a response in terms of the complexity and grammatical accuracy of sentence structures.
- The word/phrase descriptors specify the range and appropriateness of the original vocabulary used (i.e., text other than that copied and adapted from the stimulus and prompt).

When assigning a score, a rater needs to make an initial judgment about which score point (1 to 6) best describes a response and then determines whether the three descriptors for that score point suit for that response. If all three descriptors fit, a whole score point should be awarded. If

[^4]there is clear evidence that one or two descriptors from an adjacent score point are a better fit, a plus score point is awarded. In addition to scale descriptors, scoring rules address special cases where responses are nonscorable, completely or partially off-task, and completely or partially off-topic. Both nonscorable and completely off-task responses are scored as 0 . Completely offtopic responses receive a maximum score of $2+$. Partially off-task and off-topic responses are scored in their entirety using the Scoring Scale.

To calculate a raw score for the Writing test, raters' scores for each Writing task are converted to whole numbers ranging from $0-11$, as shown in Table 1.6.2A. On Tier A tests, for all grade-level clusters except for Grade 1, the scores from the three tasks are added to calculate a total raw score, which can range from $0-33$. An exception to this rule is the Grade 1 Tier A test. On this form, there are four Writing tasks. The first two of these tasks use a modified version of the scoring scale and have score ranges of $0-1$ and $0-3$ respectively. The third and fourth task use the full scoring scale from $0-11$; additionally the last task is weighted as 3 . Therefore, the possible final raw scores for Grade 1 Tier A range from 0-48.

On a Tier B or Tier C test, results from the different tasks are given different weights. (Note that for ACCESS 2.0 Series 400 Paper, the Tier B Writing test is always identical to the Tier C test. The weighting rules are also identical for Tier B and Tier C tests). These weights are specified to reflect intended amounts of time that a student should spend on each task. The first task is given a weight of 1 , the second task is given a weight of 2 , and the third task is given a weight of 3 . Thus, for example, a student with raw scores of 5,6 , and 7 on the three tasks would have a total raw score of $38(5 * 1+2 * 6+3 * 7)$, while a student with raw scores of 7,6 , and 5 on the three tasks would have a total raw score of $34(7 * 1+2 * 6+3 * 5)$. Raw scores on the Tier B/C tests can range from 0-66.

Table 1.6.2A
Rating to raw score conversion (Writing)

| Rating | Raw Score |
| :--- | :--- |
| 0 | 0 |
| 1 | 1 |
| $1+$ | 2 |
| 2 | 3 |
| $2+$ | 4 |
| 3 | 5 |
| $3+$ | 6 |
| 4 | 7 |
| $4+$ | 9 |
| 5 | 10 |
| $5+$ | 11 |

### 1.6.2.1 Scoring Procedures for Writing

Writing tasks are scored by trained raters using the ACCESS 2.0 Writing Scoring Scale. According to documentation from DRC, raters are well-educated professionals, with at least a
four-year college degree in a relevant field and a demonstrated writing ability. Prior to scoring any live student responses, the raters undergo thorough training and qualifying. Training is taskspecific in order to ensure that raters understand the nuances of each unique Writing task. Team Leaders, who are selected based on prior performance as raters and for their leadership skills, are assigned to small groups of raters; there are typically ten raters on each team. The Team Leaders are responsible for monitoring the performance of their team members and providing ongoing feedback to support accurate scoring. Scoring Directors are promoted from within DRC and earn their positions by demonstrating quality work as scorers and Team Leaders on previous projects. Scoring Directors are responsible for a specific set of tasks within a single grade-level cluster. The Scoring Directors train and oversee the teams of scorers assigned to these tasks. What follows are general scoring procedures utilized by DRC.

## Rater Training and Qualifying

- Raters are seated at stations and are assigned unique ID numbers and passwords.
- The Scoring Director provides detailed directions for use of DRC's computerized scoring system.
- The Scoring Director trains the raters using task-specific anchor sets and training sets.
- Raters must demonstrate scoring proficiency on qualifying sets before scoring live responses. Scoring proficiency is defined as $70 \%$ agreement on two qualifying sets for Writing.
- Once raters are qualified, they are further trained for their grade-level cluster on the specific tasks for which they will rate responses. After this more specific training, they take calibration sets to ensure a consistent interrater understanding of how to apply the scoring scale to their particular tasks.
- DRC uses calibration sets to calibrate the raters to the actual tasks they will be scoring.

## Routing Responses to Ensure "Blind" Second Ratings

- The DRC scoring system ensures that responses are routed to qualified raters until the prescribed number of ratings is performed for all responses.
- Raters do not know if they are the first or second rater.

## Monitoring Scoring (Quality Control)

- Ongoing quality control checks and procedures help monitor and maintain the quality of the scoring sessions. DRC monitors rater reliability with a $20 \%$ read-behind protocol. Read-behind data are monitored daily.
- Responses can be retrieved on-demand (e.g., specific grade-level clusters, specific students) should the need arise during or subsequent to the scoring process.
- If needed, responses can be rescored based on task- or response-level information, such as task number, date, score value assigned, or scorer ID.
- For Writing, DRC uses validation sets. These are sets of items seeded into the operational sets that, on a daily basis, monitor how raters are doing when compared to the known ratings of the validity sets. The raters do not know which items are operational and which are from a validation set.

## Handling Unusual Responses

- Raters can forward responses to Team Leaders for assistance.
- Responses requiring special attention, including nonscorable responses, are routed to Scoring Directors for review and resolution.

### 1.6.3 Speaking

The Speaking test is administered individually to each test taker. The test is media delivered. Students listen to an audio recording of the test input while following along in a test booklet. For each task on the Speaking test, a model student response exemplifies the task-level expectations for students and also serves as a scoring benchmark. The test administrator monitors and scores the test. Responses are immediately scored by the administrator while the test is administered. After listening to the student's responses, the administrator assigns a score. The Speaking test is scored using a scoring scale that is designed to evaluate student responses relative to the model student's response. As part of test administration, the test administrators hear the model student response before each student response, which supports them in assigning an appropriate score relative to the model response. The possible ratings are defined as follows:

- Exemplary use of oral language to provide an elaborated response. The student's language use is comparable to or going beyond the model in sophistication.
- Strong use of oral language to provide a detailed response. The student's language use is approaching that of the model in sophistication, though not as rich.
- Adequate use of oral language to provide a satisfactory response. The student's language use is not as sophisticated as that of the model.
- Attempted use of oral language to provide a response in English. The student's language use does not support an adequate response.
- No response in English.

Operationally, a score of 4 is given for every task with a score of Exemplary, 3 for Strong, 2 for Adequate, 1 for Attempted, and 0 for No Response. The sum of those scores is the total Speaking raw score for that student.

Table 1.6.3A presents the WIDA Consortium's Speaking Scoring Scale, which summarizes the scoring criteria for each score point. These criteria are applied relative to the target proficiency
level of the task (P1, P3, or P5), and the task-level expectations are embedded within the model student response. For P1 tasks, only scores of No Response (0), Attempted (1), or Adequate and above (2) are possible.

Table 1.6.3A
Speaking Scoring Scale

| ACCESS for ELLs 2.0 Speaking Scoring Scale |  |
| :--- | :--- |
| Score point | Response characteristics |
| Exemplary use of oral <br> language to provide an <br> elaborated response | - Language use comparable to or going beyond the model in sophistication <br> - Clear, automatic, and fluent delivery |
| - Precise and appropriate word choice <br> language to provide a <br> detailed response | - Language use approaching that of model in sophistication, though not as rich <br> - Clear delivery |
| Adequate use of oral <br> language to provide a <br> satisfactory response | - Language use not as sophisticated as that of model <br> - Generally comprehensible use of oral language <br> - Adequate word choice |
| Attempted use of oral <br> language to provide a <br> response in English | - Language use does not support an adequate response <br> - Comprehensibility may be compromised <br> - Word choice may not be fully adequate |
| No response (in English) | - Does not respond (in English) |

To calculate a raw score for the Speaking test, the five score points are converted to whole numbers, as shown in Table 1.6.3B. To calculate a total raw score, the raw scores for each task are added together. Speaking tasks on Tier A target PL 1 and PL 3, and Speaking tasks on tiers B and C target PL 3 and PL 5. To compute raw scores for Tiers B and C, six points are added to the total raw score, representing a score of Adequate and Above for three tasks targeting language at PL 1. Though a Tier B or C student would not have been administered any tasks targeting the PL 1 level, it is assumed that a score of Adequate and Above would be applicable to such tasks. Thus, on the tier A form, scores range from 0-18; on the B/C test, from 6-30.

Table 1.6.3B
Score point to raw score conversion (Speaking).

| Score Points | Raw Score |
| :--- | :--- |
| No Response (B, F, or I)* | 0 |
| Attempted | 1 |
| Adequate/Adequate and Above | 2 |
| Strong | 3 |
| Exemplary | 4 |

* B= Blank response; F= Foreign language response; I = Indecipherable response

### 1.6.3.1 Training Procedures for Scoring Speaking

The Speaking Test is the only portion of ACCESS 2.0 that is scored locally. Test administrators must complete the relevant online ACCESS 2.0 Paper test administrator training module (either Grades $1-5$ or Grades 6-12) for the Speaking test and pass the accompanying quiz. The training focuses on developing the test administrator's ability to score the test reliably. Separate training materials are available that address test administration and monitoring procedures. To reliably score the test, test administrators are then trained on the Speaking Scoring Scale (see Table 1.6.3A). Training materials are available for each grade-level cluster, and raters listen to anchor samples and view score justifications that provide detailed explanations for scores based on the scoring scale. Practice samples are also available so that raters can practice assigning scores. The course includes both required training material for each grade-level cluster as well as optional training material. Raters are required to complete training sections for each grade-level cluster they will administer and score. However, if a rater will score more than three grade-level clusters, they may complete rater training for only three. The quizzes include 12 items in which raters listen to and assign a score to a task response. The pass rate for the quiz is $80 \%$ correct.

## 2. An Assessment Use Argument for ACCESS 2.0: Focus on Assessment Records

One important factor in developing an assessment as a measurement tool is considering how to determine its validity. Validity is "the degree to which evidence and theory support the interpretations of test scores for proposed uses of tests" (American Educational Research Association, American Psychological Association, \& National Council on Measurement in Education [AERA, APA, \& NCME], 2014, p. 11). Evaluations of test validity assess the evidence that supports the interpretations and decisions made about test takers on the basis of their performance on a test, and the appropriateness and adequacy of such interpretations. A fully developed validation framework, including an Assessment Use Argument (AUA; Bachman \& Palmer, 2010), consists of several steps (described in Section 2.1 below) that connect test design and administration to intended and actual score interpretation and consequences. This chapter contextualizes the information presented in this Annual Technical Report within an argumentbased approach to addressing validity (Bachman \& Palmer, 2010; Chapelle, Enright, \& Jamieson, 2008; Kane, 2002, 2013; Mislevy, Almond, \& Lukas, 2004) for ACCESS 2.0.

An argument-based approach to the ACCESS 2.0 validation framework organizes the information in the present report to support claims about Assessment Records (i.e., test scores and proficiency level descriptions collected via ACCESS 2.0). Specifically, tables and figures from this report are explicitly linked to questions related to assessment data. Chapelle, Enright, \& Jamieson (2010) support using such a structure to present information to assessment users because, "based on an analysis of four points of comparison-framing the intended score interpretation, outlining the essential research, structuring research results into a validity argument, and challenging the validity argument-we conclude that an argument-based approach to validity introduces some new and useful concepts and practices" (p.3).

The complete validity argument that will be employed to support the use of ACCESS 2.0 will show the path from test design to test taker performance to the uses and interpretations of test scores and the subsequent consequences of test use. This framework is structured around assertions, or claims, about the assessment. The claims are presented as a series of statements that connect some aspect of the assessment process to the intended purposes of the assessment. Evidence for each claim is then organized by the action that is used to ensure each claim, and it includes results from analyses of test data, outside documentation, and other resources. In the complete validation argument, this process of identifying evidence to support claims will encompass the entire testing process, from the commencement of the test design to the consequences of test use (Bachman \& Palmer, 2010; Llosa, 2008); Figure 2A shows the process by which evidence supports validation actions, which are used to establish larger claims about ACCESS 2.0.

Figure 2A: General Argument Structure for Assessment Validation (simplified from Toulmin, 2003).

### 2.1 The Generic Validation Framework for ACCESS 2.0

The generic validation framework that will be applied to the entire ACCESS 2.0 testing process was developed at the Center for Applied Linguistics (CAL) and is hereafter referred to as CAL's Validation Framework. CAL's Validation Framework, shown in Figure 2.1A, combines models for both test development (i.e., Evidence-Centered Design [Mislevy, Almond, \& Lukas, 2004]) and assessment validation (i.e., the AUA from Bachman and Palmer [2010]) to cover the assessment development and implementation process from initial conceptualization to the score interpretations and consequences of using the assessment. This framework constantly looks both forward and backward, and each subsequent step depends upon the strength of the step below it; for this reason, the steps are numbered from seven to one. For example, during the initial Plan step, test developers state the anticipated decisions and consequences of implementing the assessment program, which are eventually investigated in Decisions, and Consequences represents the culmination of all previous steps. This structure highlights the fact that any weakness in a lower step affects the steps above it.

Figure 2.1A: CAL's Validation Framework (based on Bachman \& Palmer, 2010; Mislevy, Almond, \& Lukas, 2004).
In CAL's Validation Framework, Plan involves an examination of possible decisions that state educational agencies might make and consequences that might result from the assessment. This leads to the consideration of several models during Design, where specifications that answer such critical questions as "What are we measuring?" and "How do we measure it?" are developed (Mislevy, Almond, \& Lukas, 2004). The subsequent steps of the validation framework highlight the trialing, implementation, and use of the assessment results, beginning with test takers' performance on the assessment (Assessment Performance) and continuing through the collection of test scores (Assessment Records), interpretations of those test scores (Interpretations), decisions made based on the test scores (Decisions), and the consequences of test use (Consequences).

### 2.2 Focus on Assessment Records

Although the complete validation framework for ACCESS 2.0 contains seven steps (see Figure 2.1A), the data presented in this document cover only Assessment Records. By focusing on Assessment Records (i.e., test scores and proficiency level descriptions), the information in the Annual Technical Report will be used to support claims related to the quality and consistency of
the assessment data gathered and analyzed using ACCESS 2.0. The claims in this step of the AUA all pertain to the general question, "How do we know that the reported language domain scores and composite scores on ACCESS 2.0 are consistent and dependable?" Other questions about the development, administration, and outcomes of ACCESS 2.0 will be evaluated in a forthcoming document, currently in development by WIDA.

The diagram in Figure 2.2A shows a visual representation of an argument-based approach for supporting claims related to Assessment Records. The figure shows how Assessment Records (Step 4), will fit into the complete, generic validation framework. Evidence in the form of data from this report or other sources will be presented to support these claims as they relate to ACCESS 2.0.

Figure 2.2A: Structure of the Argument-Based Approach Supporting Assessment Records (Step 4) contained in this chapter.

### 2.2.1 Breakdown of Claims for the Assessment Records Produced in the ACCESS 2.0 Assessment Program

Assessment Records (Step 4) of the complete ACCESS 2.0 validation framework, is broken down into the following six claims:

C4.6. All test takers are provided comparable opportunities to demonstrate their English Language Proficiency.

C4.5. All tasks and items are scored consistently for all test takers.

C4.4. Test items/tasks work appropriately together to measure each test taker's English

## Language Proficiency.

C4.3. The same scale scores obtained by test takers in different years retain the same meaning.
C4.2. ACCESS 2.0 measures English Language Proficiency for all test takers in a fair and unbiased manner.

C4.1. Test takers are classified appropriately according to the proficiency levels defined in the WIDA English Language Development Standards.

As shown in Figure 2.2.1A, these claims depend upon each other, again moving from (C4.6) down to (C4.1). Within this organizational structure, each successive claim builds upon the previous one(s) (e.g., ratings are only useful to test developers and stakeholders if all test takers are provided comparable opportunities to demonstrate their proficiency). In the next section, these claims are broken down even further into actions that are taken to ensure the consistency and reliability of the assessment records.

Figure 2.2.1A: Progression of Claims for Step 4: Assessment Records.

### 2.3 Evidence for Assessment Records Claims of ACCESS 2.0

In this section, evidence in the form of data or other sources (e.g., test administration manuals, other information within this report, etc.) is connected to each of the Assessment Records claims via the actions taken to ensure those claims. This section denotes the sections of the report, and the tables, figures, and external sources that provide evidence related to each action. A summary table of the information presented in this section is contained in Section 2.4. Information on how to navigate the tables and figures throughout this report is presented in Section 2.5.

Because these claims relate to Assessment Records, which is Step 4 of the overall validation framework, their numbering begins with 4 . The number after the decimal denotes the level of the claim within Step 4. This numbering system is used in anticipation of the development of more complete documentation of a validity argument for ACCESS 2.0, which will be completed by WIDA. Individual actions to ensure each claim are denoted by the corresponding letter (a, b, c, and so on).

## Claim 4.6 - All test takers are provided comparable opportunities to demonstrate their English Language Proficiency.

Action 4.6a: Well-specified procedures were developed for test administrators so that they are able to administer the test consistently.

Evidence: Procedures for administering the test and producing reported scores are documented in the ACCESS 2.0 Test Administrator Manual. ${ }^{1}$

Action 4.6b: Test administrators document and report any irregularities that may occur so that appropriate action may be taken.

Evidence: General processes and procedures for test irregularities due to student condition, testing environment, or other unusual occurrences can be found in the District and School Test Coordinator Test Administrator Manual. ${ }^{2}$ Specific testing situations, including where to start and stop the test, when breaks can be taken, material management protocol in the case of damaged testing material, and other detailed guidance, can be found in the Test Administrator Manual. States each have a specific policy for Test Administrators to follow in the case of a testing irregularity, which can include steps such as documentation to use or notification procedures to follow. These state specific steps can be found on the ACCESS 2.0 State Checklists, found on the state pages ${ }^{3}$ and within the training course. Additionally, the ACCESS 2.0 Training Course highlights common testing irregularities and the resources to use in these circumstances.

[^5]In the case that the test administrator has additional questions about how to proceed in the event of a testing irregularity, the WIDA Client Services Center can be contacted via email at help@ wida.us or toll free at 1-866-276-7735.

Action 4.6c: Procedures are in place to ensure that items and tasks do not have issues with bias or sensitivity.

Evidence: As detailed in Section 1.3.2, all test items and tasks are subject to bias and sensitivity reviews. These reviews examine items to ensure that they do not favor students from a particular SES, geographic area, educational background, or introduce other systematic biases.

## Claim 4.5 - All items and tasks are scored consistently for all test takers.

Action 4.5a: Raters of performance-based tasks undergo training so that they know how to score appropriately.

Evidence: Section 1.6 of this report specifies the scoring procedure for ACCESS 2.0. Section 1.6.2 provides information rater training and qualifying protocols for the Writing domain, which is centrally scored by DRC. The Speaking test is locally scored. Section 1.6.3.1 details the training processes that should be followed by local schools and districts. Local schools and districts are responsible for ensuring that each rater is properly trained using these materials, for providing sufficient time and training to prepare raters for rating the speaking test, ensuring that that the appropriate resources needed to rate the Speaking test are provided, and for routinely monitoring the rating of speaking tests and evaluating inter-rater reliability indices.

Action 4.5b: Listening and Reading items are scored electronically using a carefully checked key.

Evidence: Section 1.6 of this report specifies the scoring procedure for ACCESS 2.0. Listening and Reading items are dichotomous and are scored electronically by DRC (see Section 1.6.1).

Action 4.5c: Raters of performance-based tasks are certified, demonstrating that they can score appropriately.

Evidence: Section 1.6 of this report specifies the scoring procedure for ACCESS 2.0. Writing tasks are centrally scored at DRC, and all raters are pre-screened, trained, and subject to qualifying scoring tests before becoming operational raters. Once raters are qualified, they then undergo additional training on the grade-level cluster and specific tasks they will be scoring. Following this more intense training, the raters are subject to calibration sets to ensure that they are properly calibrated to the grade cluster and task(s) (see Section 1.6.2).

Speaking is scored by the local test administrator after the completion of training on test administration and on the Speaking Rubric (see Section 1.6.3).

Action 4.5d: Raters of Writing tasks are monitored daily to ensure that they are scoring appropriately.

Evidence: DRC provides raters of performance-based tasks with specially prepared calibration sets each day to ensure that the scoring rubric is being applied consistently across scoring sessions (see Section 1.6.2). For the Writing test, pre-rated and vetted validation sets are seeded into the operational items for scoring. The validation sets are utilized to ensure that raters are scoring accurately and consistently and any drift is identified and promptly corrected.
Action 4.5e: Scoring data for Writing tasks are analyzed for rater agreement to understand how closely raters agree.

Evidence: For a sample of $20 \%$ of responses to each task, interrater reliability is calculated for each of the Writing tasks (see Section 5.2.8; see Table 6F). During operational scoring, these data are monitored daily for quality control purposes.

Claim 4.4 - Test items/tasks work appropriately together to measure each test taker's English Language Proficiency.

Action 4.4a: For each test form (e.g., Reading 6-8B), item and task analyses are performed and psychometric properties of the items and tasks are evaluated to confirm that scores are internally consistent.
Evidence: Section 5.2.8 describes the ways in which test reliability is computed for the forms. Results are presented in Table 6F.

Action 4.4b: For each domain and composite score across tiers, item and task analyses are performed and psychometric properties of the items and tasks are evaluated to confirm that scores are internally consistent.

Evidence: A single reliability estimate, a stratified Cronbach's alpha (Cronbach, Schonemann, \& McKie, 1965), is calculated across the three tiers for each domain. Cronbach's alpha indicates the extent to which items work together to measure the same construct. The stratified Cronbach's alpha is an average reliability, and it is used when test takers are administered several related subtests but are then evaluated based on a composite of those subtest scores. Table 8D presents the data used to calculate an estimate of the reliability of the composite scores using a stratified Cronbach's alpha (see also Section 7.1.1.).

Action 4.4c: Analyses of Rasch model fit statistics are conducted to show that individual tasks perform appropriately.

Evidence: The Complete Item or Task Analysis Summary table includes information on the Rasch fit statistics for each test item (see Section 5.2.9, Table 6G). These statistics, called outfit mean square and infit mean square statistics, are calculated by comparing the observed empirical data with the values that the Rasch model expects test takers to produce. Infit and outfit statistics indicate any consistently unusual performance in relation to the item's difficulty measure by
measuring the degree to which examinees' responses to items deviate from expected responses. Both statistics have an expected value of 1.0 . Items with infit and outfit mean square statistics between 0.5 and 1.5 are considered "productive for measurement" (Linacre, 2002). Values between 1.5 and 2.0 are "unproductive for construction of measurement, but not degrading." Values greater than 2.0 might "distort or degrade the measurement system." Values below 0.5 are "less productive for measurement, but not degrading." Infit helps ensure that test takers within a range of the targeted proficiency level perform as expected. It is not as sensitive to outliers as outfit. Outfit can be skewed if test takers with extreme (i.e., high-level or low-level) proficiency do not perform as expected. High infit is a bigger threat to validity, but is more difficult to explain than high outfit (Linacre, 2002). The infit and outfit mean square statistics are part of the evaluation criteria used to select the items and tasks that appear on the final operational forms.

Action 4.4d: Items and tasks of appropriate difficulty are chosen for each domain.
Evidence: The Complete Item or Task Analysis and Summary tables (see Section 5.2.9, Tables $6 \mathrm{G})$ provide information on the difficulty of each item or task. Section 5.2 .9 describes the construction of these tables. When the test is assembled, task difficulty is one of several criteria used to select appropriate items for operational assessment from the pool of field tested items.

## Claim 4.3 - The same scale scores obtained by test takers in different years retain the same meaning.

Action 4.3a: A sufficient number of items and tasks are used as anchor items across adjacent years to maintain a consistent scale from year to year.

Evidence: For ACCESS 2.0 Series 400 Paper, the Listening and Reading test forms were reused forms from ACCESS Series 302. See Section 1.3.3 for further detail.

For ACCESS 2.0 Series 400 Paper Speaking and Writing, all tasks were new. Equipercentile linking was conducted to link the distribution of scores on ACCESS 2.0 Series 400 to the distribution of scores on ACCESS Series 303. See Section 1.3.4.2 for further information on equipercentile linking.

Action 4.3b: New items and tasks are calibrated with anchor items to ensure that their difficulty measures are on the same consistent scale that is used from year to year.

Evidence: In typical years for the original ACCESS test, both new and previously used items and tasks (i.e., anchor items) are included on each test form (see Table 6G for a list of new and anchored test items/tasks).

For ACCESS 2.0 Series 400, which marks the transition between the original ACCESS test and ACCESS 2.0, there were no test forms which had a mix of both old and new items and tasks. Consistency with the original ACCESS scale was maintained in two ways. In the domains of Listening and Reading, the Series 400 Paper tests are reused forms of the ACCESS Series 302
test. In the domains of Writing and Speaking, equipercentile linking was conducted to maintain the distribution of scale scores across years (see Section 1.3.4.2).

Action 4.3c: The same scaling equation is applied from year to year to ensure that scale scores are obtained consistently over time.

Evidence: The following scaling equations are used to convert ability measures in logits to scale scores:

- L: (Ability Measure in Logits*37.571) + 316.637
- R: (Ability Measure in Logits*26.000) +323.272

These equations have been in use from the first operational administration of ACCESS (Series 100).

For Writing and Speaking, because an equipercentile approach was used for scaling results, scaling equations were not used for ACESS 2.0 Series 400. Scaling was conducted during the ACESS 2.0 Series 400 operational year, and new scaling equations for these domains will be applied to ACCESS 2.0 Series 401. See Section 1.3.4.2 for further information on equipercentile linking.

Claim 4.2 - ACCESS 2.0 measures English Language Proficiency for all test takers in a fair and unbiased manner.

Action 4.2a: Differential item functioning (DIF) analyses are conducted to determine whether any items or tasks may be biased against certain subgroups.

Evidence: Results of DIF analyses are provided in Table 6H (see Section 5.2.10 for an overview of these tables). Analyses search for bias in contrasting groups based on gender (male versus female) and ethnicity (Hispanic versus non-Hispanic). Table H in Chapter 6 shows the number of items that favored one group or the other at all levels of DIF.

Action 4.2b: Items that show evidence of DIF are carefully reviewed so that any that indicate bias are not used for scoring and are removed from future test forms.

Evidence: If an item shows C-level DIF, a content review panel is convened to examine the content of the item. The panel is composed of diverse members and is chosen carefully so that panelists include male and female members as well as bilingual individuals who speak either English and Spanish or English and another language. The panel then comes to a consensus on whether or not the item content is likely to favor or disfavor specific subgroups of students.

## Claim 4.1 - Test takers are classified appropriately according to the proficiency levels defined in the WIDA English Language Development Standards.

Action 4.1a: Distributions of scale scores and proficiency levels for each domain are analyzed to confirm that ACCESS 2.0 effectively measures the performance of test takers across the range of English Language Proficiency levels as defined by the WIDA ELD Standards.

Evidence: The distribution of test takers' raw scores on ACCESS 2.0, organized by individual test form (e.g., Reading 3-5B), shows the extent to which ACCESS 2.0 effectively measures the performance of test takers across the range of ELD abilities that each form was designed to assess (see Section 5.2.1; see Table 6A; see Table 6B).

The distribution of test takers' scale scores on ACCESS 2.0, organized by test form (e.g., Reading 3-5B), shows that ACCESS 2.0 effectively measures the performance of test takers across the range of ELD abilities that each form was designed to assess (see Section 5.2.2; see Table 6B; see Figure 6B).

The proficiency level distribution of test takers' scores on ACCESS 2.0, organized by individual test form (e.g., Reading 3-5B), shows that ACCESS 2.0 effectively measures the performance of test takers across the range of proficiency levels that each form was designed to assess (see Section 5.2.3; see Table 6C; see Figure 6C).

The Raw Score to Proficiency Level Score table shows the interpretive proficiency level score associated with each raw score (see Section 5.2.12; see Table 6J). This distribution of scores shows that ACCESS 2.0 effectively measures the performance of test takers across the range of proficiency levels that each form was designed to assess.

The Test Characteristic Curve for each test form graphically shows the relationship between test takers' ability measure (which is calculated based on test performance using Rasch modeling) on the horizontal axis and the expected raw scores on the vertical axis (see Section 5.2.6; see Figure 6D). Five vertical lines indicate the five cut scores for the highest grade in the cluster, dividing the figure into six sections for each of the six WIDA language proficiency levels. The curve shows that higher expected raw scores are required to be placed into higher language proficiency levels. Note that for Series 400, the test forms for Writing and Speaking were linked to ACCESS Series 303 using an equipercentile linking methodology. The Test Characteristic Curve is not appropriate for this year's assessment. See Section 1.3.4.2 for further information on equipercentile linking.

Action 4.1b: Distributions of scale scores and proficiency levels, organized by grade-level cluster, are analyzed to confirm that ACCESS 2.0 effectively measures the performance of test takers across the range of English Language Proficiency levels as defined by the WIDA ELD Standards.

Evidence: The distribution of test takers' scale scores on ACCESS 2.0, organized by grade-level cluster, shows that ACCESS 2.0 effectively measures the performance of test takers across the range of ELD abilities as described by the WIDA ELD Standards (see Section 7.2.1; Table 8A; see Figure 8A).

The proficiency level distribution of test takers' scores on ACCESS 2.0, organized by gradelevel cluster, shows that ACCESS 2.0 effectively measures the performance of test takers across the range of proficiency levels as defined by the WIDA ELD Standards (see Section 7.2.2; see Table 8B; see Figure 8B).

The Test Characteristic Curve reflects test takers' mean raw scores by domain on ACCESS 2.0 across the entire test for Kindergarten and across the three tiers for the other grade-level clusters (see Section 7.2.4; Figure 8C). It also graphically illustrates how the tiers differ in difficulty, showing that ACCESS 2.0 effectively captures a range of ELD ability levels. Tier A is represented by a dotted curve, Tier B by a light solid curve, and Tier C by a dark solid curve. As shown, Tier B is more difficult than Tier A, and Tier C is more difficult than Tier B.

Note that for ACCESS 2.0 Series 400, the test forms for Writing and Speaking were linked to ACCESS Series 303 using an equipercentile linking methodology (described in Section 1.3.4.2). The Test Characteristic Curve is not appropriate for this year's assessment.

Action 4.1c: For each test form, analyses are run to confirm that English Language Proficiency is measured with high precision at the cut points pertinent to each tier.

Evidence: The Test Information Function graphically shows how well the test is measuring across the ability measure spectrum, which is calculated based on test performance using Rasch modeling (see Section 5.1.1; see Figure 6E). High values indicate more accuracy in measurement. Test forms for different tiers are designed to measure most accurately at certain proficiency levels (i.e., PL1 through PL3 for Tier A, PL2 through PL4 for Tier B, and PL3 and up for Tier C), and the expected peak of the distribution should occur within the desired range of the cut scores.

Note that for ACCESS 2.0 Series 400, Test Information Function figures are provided for Listening and Reading. Test Information Function figures are not provided for Writing and Speaking, as the equipercentile linking methodology means that the Speaking and Writing task parameters are not on the ACCESS logit scale.

Action 4.1d: Across domains, analyses are run to confirm that English Language Proficiency is measured with high precision at the cut points pertinent to each tier.

Evidence: The conditional standard error of measurement (CSEM) at the cut point provides information on how precisely test takers' performances on ACCESS 2.0 are measured at the cut points between language proficiency levels. These cut points are critical because they are the points at which decisions are made about test taker placements. The CSEM at the cut score point tables provide information on the conditional standard error of measurement at the cut scores by grade-level cluster and domain. Because the cut points depend on the grade, information for each domain is provided for each grade within a grade-level cluster (see Section 7.2.3; see Table 8C).

From Table 8C, it is possible to examine how well the different tiers measure the English Language Proficiency of test takers at the appropriate proficiency level cut scores (i.e., PL1 through PL3 for Tier A, PL2 through PL4 for Tier B, and PL3 and up for Tier C).

Note that for ACCESS 2.0 Series 400, the CSEM values are estimated from the equipercentile linking (see Section 1.3.4.2 and Section 7.2.3).

The Test Information Function reflects the precision of measurement by graphically presenting the standard error of measurement across tiers for grade-level clusters (see Section 7.2.5, see Figure 8D). Tier A is represented by a dotted curve, Tier B by a light solid curve, and Tier C by a dark solid curve. As shown, Tier B is more difficult than Tier A, and Tier C is more difficult than Tier B. As in Figure C (see Section 7.2.4), the cut scores at the highest grade in each cluster are indicated by vertical lines. These lines make it easy to see that the test forms for different tiers measure most accurately at the proficiency levels they are intended to capture.

Note that for ACCESS 2.0 Series 400, Test Information Function figures are provided for Listening and Reading. Test Information Function figures are not provided for Writing and Speaking, as the equipercentile linking methodology means that the Speaking and Writing task parameters are not on the ACCESS logit scale.

Action 4.1e: Classification and accuracy analyses are conducted by grade level to confirm that proficiency level classifications are reliable for all domain and composite scores.

Evidence: Information related to the accuracy of test takers' proficiency-level classifications is presented in multiple ways (see Section 7.2.7; see Table 8E). A separate table is provided for each grade in a grade-level cluster. The table provides overall indices related to the accuracy and consistency of classification. These indices indicate the percentage of all test takers who would be classified into the same language proficiency level by both the administered test and either the true score distribution (accuracy) or a parallel test (consistency). Table 8E also shows accuracy and consistency information conditional on level and provides indices of classification accuracy and consistency at the cut points.

### 2.4 Summary of Assessment Records Claims, Actions, and Evidence

Table 2.4A
Summary of Assessment Records Claims, Actions, and Evidence

| Claim | Actions | Evidence |
| :--- | :--- | :--- |
| 6. All test takers are <br> provided comparable <br> opportunities to <br> demonstrate their <br> English Language <br> Proficiency. | a. Well-specified procedures were developed <br> for test administrators so that they are able to <br> administer the test consistently. <br> b. Test administrators document and report any <br> irregularities that may occur so that <br> appropriate action may be taken. <br> c. Procedures are in place to ensure that items <br> and tasks do not have issues with bias or <br> sensitivity. | b.Evidence summarized with claim at |
| c. Section 1.3.2 |  |  |

| 3. The same scale scores obtained by test takers in different years retain the same meaning. | a. A sufficient number of items and tasks are used as anchor items across adjacent years to maintain a consistent scale from year to year. <br> b.New items and tasks are calibrated with anchor items to ensure that their difficulty measures are on the same consistent scale that is used from year to year. <br> c. The same scaling equation is applied from year to year to ensure that scale scores are obtained consistently over time | a. Section 1.3.3, section 1.3.4.2 <br> b. $\mathrm{n} / \mathrm{a}$ for Series 400 Paper, see discussion with claim 4.3b <br> c. Evidence summarized with claim at 4.3c, see also Section 1.3.4.2. |
| :---: | :---: | :---: |
| 2. ACCESS 2.0 measures English Language Proficiency for all test takers in a fair and unbiased manner. | a. Differential item functioning (DIF) analyses are conducted to determine whether any items or tasks are biased against certain subgroups. <br> b.Items that show evidence of DIF are carefully reviewed so that any that indicate bias are not used for scoring and are removed from future test forms | a. Section 5.2.10, Table 6H <br> b.Evidence summarized with claim at 4.3b |
| 1. Test takers are classified appropriately according to the proficiency levels defined in the WIDA English Language Development Standards. | a. Distributions of raw scores, scale scores and proficiency levels for each domain are analyzed to confirm that ACCESS 2.0 effectively measures the performance of test takers across the range of English Language Proficiency levels as defined by the WIDA English Language Development Standards. <br> b. Distributions of scale scores and proficiency levels, organized by grade-level cluster, are analyzed to confirm that ACCESS 2.0 effectively measures the performance of test takers across the range of English Language Proficiency levels as defined by the WIDA English Language Development Standards. <br> c. For each test form, analyses are run to confirm that English Language Proficiency is measured with high precision at the cut points pertinent to each tier. <br> d. Across domains, analyses are run to confirm that English Language Proficiency is measured with high precision at the cut points pertinent to each tier <br> e. Classification and accuracy analyses are conducted by grade-level to confirm that proficiency level classifications are reliable for all domain and composite scores. | a. Sections 5.2.1.; 5.2.2.; 5.2.3; 5.2.6; 5.2.12; Tables 6A; 6B; 6C; 6J; Figures 6A; 6B; 6C; 6D. <br> b. Sections 7.2.1; 7.2.2; 7.2.4; Tables 8A; 8B; Figures 8A; 8B; 8C. <br> c. ### 2.5 Visual Guide to Tables and Figures

This section provides a visual overview to the tables and figures contained in this report. For readers who are reviewing this report in an electronic format, section headers are built into the document structure to assist the reader to navigate through the document.

### 2.5.1 Guide to Chapter 4, Student Results

Chapter 4 has three subsections:

- 4.1 Participation
- 4.2 Scale Score Results
- 4.3 Proficiency Level Results

Section 4.1, Participation, presents distributions of students' participation by grade and gradelevel cluster. Table 2.5 .1 A provides an overview of the tables included in this section.

Table 2.5.1A
Table Numbering System for Section 4.1, Participation

### 4.1.1. Participation by Grade-level Cluster

| Table | Title |
| :--- | :--- |
| 4.1.1.1 | Participation by Grade-Level Cluster by State |
| 4.1 .1 .2 | Participation by Grade-Level Cluster by Gender |
| 4.1.1.3 | Participation by Grade-Level Cluster by Ethnicity |
| 4.1.2. Participation by Grade |  |
| Table | Title |
| 4.1 .2 .1 | Participation by Grade by State |
| 4.1 .2 .2 | Participation by Grade by Gender |
| 4.1.2.3 | Participation by Grade by Ethnicity |

### 4.1.3. Participation by Tier

| Table | Title |
| :--- | :--- |
| 4.1 .3 .1 | Participation by Grade-Level Cluster by Tier and by Domain |
| 4.1 .3 .2 | Participation by Grade by Tier and by Domain |
| 4.1 .3 .3 | Participation by Grade-Level Cluster by Tier and by Gender |
| 4.1 .3 .4 | Participation by Grade-Level Cluster by Tier and by Ethnicity |

Section 4.2, Scale Score Results, presents distributions of scale score results by grade and by grade-level cluster. These are further broken down by gender and ethnicity, and finally, correlations among scale score results are presented. Table 2.5.1.B presents the section numbering system for this section.

Table 2.5.1B
Section Numbering System for Section 4.2, Scale Score Results

| Mean Scale Scores Across Domain and Composite |  |  |
| :--- | :---: | :---: |
| 4.2.1. By Grade-level Cluster | 4.2.2. By Grade |  |
| Alone | 4.2 .1 .1 | 4.2 .2 .1 |
| And by Gender | 4.2 .1 .2 | 4.2 .2 .2 |
| And by Ethnicity | 4.2 .1 .3 | 4.2 .2 .3 |

### 4.2.3. Correlations Among Scale Scores by Grade-level Cluster

Section 4.3, Proficiency Level Results, presents distributions of students' proficiency level results for the four domains and four composites, by grade and by grade-level cluster. Table 2.5.1C lists the numbering system for subsections. Each subsection contains a table expressing descriptive statistics as counts (Table A) and percentages (Table B).

Table 2.5.1C
Section Numbering System for Section 4.3, Proficiency Level Results

|  |  | By Grade-Level <br> Cluster by Tier | By Grade by Tier | By Grade |
| :--- | :--- | :--- | :--- | :--- |
|  |  | For each, distributions by count and by percent |  |  |
| 4.3 .1 | Listening | 4.3 .1 .1 | 4.3 .1 .2 | 4.3 .1 .3 |
| 4.3 .2 | Reading | 4.3 .2 .1 | 4.3 .2 .2 | 4.3 .2 .3 |
| 4.3 .3 | Writing | 4.3 .3 .1 | 4.3 .3 .2 | 4.3 .3 .3 |
| 4.3 .4 | Speaking | 4.3 .4 .1 | 4.3 .4 .2 | 4.3 .4 .3 |
| 4.3 .5 | Oral Composite | 4.3 .5 .1 | 4.3 .5 .2 | 4.3 .5 .3 |
| 4.3 .6 | Literacy Composite | 4.3 .6 .1 | 4.3 .6 .2 | 4.3 .6 .3 |
| 4.3 .7 | Comprehension Composite | 4.3 .7 .1 | 4.3 .7 .2 | 4.3 .7 .3 |
| 4.3 .8 | Overall Composite | 4.3 .8 .1 | 4.3 .8 .2 | 4.3 .8 .3 |

### 2.5.2. Guide to Chapter 6, Analyses of Test Forms Results

Chapter 6 is organized by grade-level cluster. Each grade-level cluster is divided into 4 subsections, one for each domain, as follows.

Table 2.5.2A
Section Numbering System for Chapter 6, Analysis of Test Forms Results

|  | Grade-level Cluster |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Domain or Composite | $\mathbf{K}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4 - 5}$ | $\mathbf{6 - 8}$ | $\mathbf{9 - 1 2}$ |
| Listening | 6.1 .1 | 6.2 .1 | 6.3 .1 | 6.4 .1 | 6.5 .1 | 6.6 .1 | 6.7 .1 |
| Reading | 6.1 .2 | 6.2 .2 | 6.3 .2 | 6.4 .2 | 6.5 .2 | 6.6 .2 | 6.7 .2 |
| Writing | 6.1 .3 | 6.2 .3 | 6.3 .3 | 6.4 .3 | 6.5 .3 | 6.6 .3 | 6.7 .3 |
| Speaking | 6.1 .4 | 6.2 .4 | 6.3 .4 | 6.4 .4 | 6.5 .4 | 6.6 .4 | 6.7 .4 |

The 28 subsections in Table 2.5.2A are further divided by tier. For each of the tier subsections, the following tables and figures are presented:

Table 2.5.2B
Table and Figure Numbering System for Chapter 8, Analysis Across Tiers Results

|  | Figure | Table |
| :--- | :---: | :---: |
| Raw Score Distributions | A | A |
| Scale Score Distributions | B | B |
| Proficiency Level Distributions | C | C |
| Scaling Equation |  | D |
| Equating Summary | D | E |
| Test Characteristic Curve | E | F |
| Test Information Function |  | G |
| Reliability | H |  |
| Complete Item/Task Analysis and Summary | I |  |
| DIF Analysis and Summary | J |  |
| Raw Score to Scale Score Conversion Chart |  |  |
| Raw Score to Proficiency Level Conversion Chart |  |  |

### 2.5.3 Guide to Chapter 8, Analysis Across Tiers Results

Chapter 8 is organized by grade-level cluster. Each grade-level cluster is divided into 8 subsections, one for each domain and one for each composite, as follows.

Table 2.5.3A
Section Numbering System for Chapter 8, Analysis Across Tiers Results

|  | Grade-level Cluster |  |  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Domain or Composite | $\mathbf{K}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4 - 5}$ | $\mathbf{6 - 8}$ | $\mathbf{9 - 1 2}$ |
| Listening | 8.1 .1 | 8.2 .1 | 8.3 .1 | 8.4 .1 | 8.5 .1 | 8.6 .1 | 8.7 .1 |
| Reading | 8.1 .2 | 8.2 .2 | 8.3 .2 | 8.4 .2 | 8.5 .2 | 8.6 .2 | 8.7 .2 |
| Writing | 8.1 .3 | 8.2 .3 | 8.3 .3 | 8.4 .3 | 8.5 .3 | 8.6 .3 | 8.7 .3 |
| Speaking | 8.1 .4 | 8.2 .4 | 8.3 .4 | 8.4 .4 | 8.5 .4 | 8.6 .4 | 8.7 .4 |
| Oral Composite | 8.1 .5 | 8.2 .5 | 8.3 .5 | 8.4 .5 | 8.5 .5 | 8.6 .5 | 8.7 .5 |
| Literacy Composite | 8.1 .6 | 8.2 .6 | 8.3 .6 | 8.4 .6 | 8.5 .6 | 8.6 .6 | 8.7 .6 |
| Comprehension Composite | 8.1 .7 | 8.2 .7 | 8.3 .7 | 8.4 .7 | 8.5 .7 | 8.6 .7 | 8.7 .7 |
| Overall Composite | 8.1 .8 | 8.2 .8 | 8.3 .8 | 8.4 .8 | 8.5 .8 | 8.6 .8 | 8.7 .8 |

For each domain and composite subsection, the following tables and figures are presented:

Table 2.5.3B
Table and Figure Numbering System for Chapter 8, Analysis Across Tiers Results

|  | Figure | Table | Applies to |
| :--- | :---: | :---: | :--- |
| Scale Score Distributions | A | A | Domains and Composites |
| Proficiency Level Distributions | B | B | Domains and Composites |
| CSEM at Cut Scores |  | C | Domains only |
| Test Characteristic Curve | C |  | Domains only |
| Test Information Function | D |  | Domains only |
| Weighted Reliability |  | D | Domains and Composites |
| Accuracy and Consistency of Classification |  | E | Domains and Composites |

## 3. Descriptions of Student Results

Chapter 3 provides a description of the tables that appear in Chapter 4.

### 3.1 Participation

Participation in ACCESS 2.0 Paper is shown in three ways: by grade-level cluster; by grade, and by tier.

### 3.1.1 Grade-Level Cluster

Chapter 4.1.1 gives information on participation by grade-level cluster.
Table 4.1.1.1 shows participation across the 38 WIDA states that participated in the operational testing program of ACCESS 2.0 Paper in 2015-2016. The first row shows the grade-level cluster, the next 38 rows show the number of students in that grade-level cluster who took the test by state, and the final row shows the total number of participants across all 38 states.

Table 4.1.1.2 shows participation by grade-level cluster and by gender across all 38 states combined, while Table 4.1.1.3 shows participation by grade-level cluster and by ethnicity across all 38 states.

### 3.1.2 Grade

Section 4.1.2 provides similar data as the previous section, but it is broken out by grade rather than by grade-level cluster.

### 3.1.3 Tier

Section 4.1.3 gives information on participation by tier.
Table 4.1.3.1 shows this information by grade-level cluster, tier, and domain.
Table 4.1.3.2 shows the same information, but by grade rather than by grade-level cluster.
Table 4.1.3.3 shows the breakdown by grade-level cluster and tier for gender.
Table 4.1.3.4 shows the same information for ethnicity (Hispanic vs. Non-Hispanic). Consortium member states use the Census Bureau categories for student ethnicity.

Note that in some circumstances there was a mismatch between a student's reported grade and the reported grade-level cluster of the test the student took (e.g., a student who was reported to be in Grade 5 was administered a test in the 6-8 grade-level cluster). In all, 586 students were administered a test form for a grade-level cluster other than their reported grade. Table 3.1 below shows the number of students in each grade who were administered out-of-grade tests, and the test forms that they were administered. The data for these students was eliminated from all analyses in this report.

Table 3.1
Students Excluded from Analysis due to Grade/Grade-Level Cluster Mismatch

| Grade | Grade-Level Cluster and Tier |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 1 |  |  | 2 |  |  | 3 |  |  | 4-5 |  |  | 6-8 |  |  | 9-12 |  |  |  |
|  | K | A | B | C | A | B | C | A | B | C | A | B | C | A | B | C | A | B | C |  |
| K |  | 27 | 9 | 4 | 5 | 7 | 1 | 7 | 3 | 1 | 4 | 2 | 3 | 5 | 1 | 1 | 7 | 3 | 1 | 91 |
| 1 | 131 |  |  |  | 11 | 8 | 7 | 6 | 1 | 1 | 3 | 3 | 2 | 4 | 1 | 2 | 4 | 1 | 0 | 185 |
| 2 | 10 | 19 | 23 | 10 |  |  |  | 10 | 13 | 6 | 4 | 1 | 0 | 0 | 1 | 1 | 2 | 0 | 4 | 104 |
| 3 | 10 | 1 | 1 | 0 | 7 | 8 | 8 |  |  |  | 12 | 17 | 6 | 1 | 0 | 1 | 0 | 1 | 1 | 74 |
| 4 | 5 | 1 | 0 | 0 | 0 | 0 | 1 | 7 | 4 | 1 |  |  |  | 0 | 0 | 3 | 0 | 1 | 0 | 23 |
| 5 | 5 | 0 | 0 | 0 | 0 | 0 | 2 | 3 | 3 | 2 |  |  |  | 4 | 5 | 7 | 0 | 0 | 0 | 31 |
| 6 | 1 | 2 | 0 | 0 | 0 | 0 | 0 | 0 | 2 | 0 | 4 | 2 | 1 |  |  |  | 0 | 1 | 0 | 13 |
| 7 | 2 | 0 | 0 | 0 | 0 | 1 | 1 | 2 | 3 | 0 | 1 | 1 | 1 |  |  |  | 1 | 0 | 0 | 13 |
| 8 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |  |  |  | 4 | 5 | 3 | 16 |
| 9 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 7 | 3 |  |  |  | 12 |
| 10 | 2 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 2 | 0 | 2 |  |  |  | 10 |
| 11 | 2 | 5 | 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |  |  |  | 11 |
| 12 | 1 | 0 | 0 | 0 | 0 | 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |  |  | 3 |
| Total | 171 | 57 | 37 | 14 | 23 | 26 | 21 | 36 | 29 | 11 | 29 | 26 | 14 | 18 | 15 | 20 | 18 | 12 | 9 | 586 |

### 3.2 Scale Score Results

### 3.2.1 Mean Scale Scores Across Domain and Composite Scores Section

Chapter 4.2.1 shows mean (average) scale scores by grade-level cluster across the eight scores awarded on ACCESS, first for the four domains (Listening, Speaking, Reading, and Writing) and then for the four composites (Oral Language, Literacy, Comprehension, and Overall). In this section, under each average, the number of students in each group is also given.

Table 4.2.1.1 shows mean scale scores by grade-level cluster, while Table 4.2.1.2 shows the same information broken down by gender, and Table 4.2.1.3 shows the same information broken down by race and ethnicity. In 2010, the Census Bureau introduced a new approach to reporting race and ethnicity. Previously, race and ethnicity had been a single category with six values (Hispanic, Asian/Pacific Islander/Hawaiian, Black/African American, American Indian/Alaskan Native, White-Non Hispanic, and Multi-racial/Other). Under the new approach, ethnicity has become a binary category (Hispanic or Non-Hispanic), with five categories for race (American Indian/Alaskan Native, Asian, Black/African American, Pacific Islander/Hawaiian, and White) that are not mutually exclusive. Thus, for example, Student A may be labeled as Hispanic for ethnicity and Asian for race, while Student B may be labeled as Non-Hispanic for ethnicity and both American Indian/Alaskan Native and Black/African American for race. Starting with Series 202, students who are labeled as Hispanic are included in the Hispanic (Of Any Race) category,
regardless of how many racial categories they are included in. Students who are identified as one of the racial categories (e.g., Asian) and have not been identified as Hispanic are identified in only one racial category; if they are identified in more than one racial category, and have not been identified as Hispanic, then they are labeled Non-Hispanic Multi-racial.

Section 4.2.2 shows the mean scale scores broken down by grade rather than by grade-level cluster. Table 4.2.2.1 shows mean scale scores by grade, while Table 4.2.2.2 shows the same information broken down by gender, and Table 4.2.2.3 shows the same information broken down by ethnicity and race.

### 3.2.2 Correlations

Tables 4.2.3A through 4.2.3G show correlations among the four domain scale scores by gradelevel clusters across all tiers, as well as the number of students included in each correlation. Table 4.2.3A shows the results for Kindergarten, Table 4.2.3B shows the results for grade-level cluster 1, Table 4.2.3C shows the results for grade-level cluster 2, Table 4.2.3D shows the results for grade-level cluster 3, Table 4.2.3E shows the results for grade-level cluster 4-5, Table 4.2.3F shows the results for grade-level cluster 6-8, and Table 4.2 .3 G shows the results for grade-level cluster 9-12. Beginning with Series 101, caps were placed on students taking Tier A and Tier B test forms in Listening and Reading. This capping of scores may raise the correlation between those two scores, while decreasing the correlation of those two scores with Speaking and Writing. Note that all correlations in Tables 4.2.3A through 4.2.3G are significant at the 0.01 level (2-tailed).

### 3.3 Proficiency Level Results

Proficiency level results show the distribution of students falling into the six language proficiency levels outlined by the WIDA ELD Standards. The results are presented in eight subsections by count and percentage:

Table 4.3.1 Listening
Table 4.3.2 Reading
Table 4.3.3 Writing
Table 4.3.4 Speaking
Table 4.3.5 Oral Language Composite
Table 4.3.6 Literacy Composite
Table 4.3.7 Comprehension Composite
Table 4.3.8 Overall Composite
Within each section, results are first presented by grade-level cluster and tier in Section 4.3.*. 1 (note that * indicates a subsection variable). Tables 4.3.*.1A shows the number of students who were classified into each language proficiency level, while Table 4.3.*.1B shows the percentage
of students (within each row) classified into each language proficiency category. These tables clearly show the effect of the capping of scores on Tier A and Tier B for Listening and Reading. Following the presentation by tier and cluster, results are presented by grade and tier in Section 4.3.*.2. Again, the first table in this section shows the number of students classified into each language proficiency level, while the second table shows the results in terms of percentages within each row.

Finally, in Section 4.3.*.3, results are presented by grade alone, that is, without the tiers. Again, the first table shows the number of students classified into each language proficiency level, while the second table shows the results in terms of percentages within each row.

## 4 Student Results

### 4.1 Participation

### 4.1.1 Participation by Grade-Level Cluster

### 4.1.1.1 By State

Table 4.1.1.1
Participation by Cluster by State S400 Paper

|  | Cluster |  |  |  |  |  |  |  |

## 5. Analyses of Test Forms: Overview

This chapter contains two parts. The first part provides background information on the technical measurement and statistical tools used to analyze ACCESS 2.0 Paper. The second part explains the results that are presented for each test form in Chapter 6.

### 5.1 Background

### 5.1.1 Measurement Models Used

The measurement model that forms the basis of the analysis for the development of ACCESS for ELLs is the Rasch measurement model (Wright \& Stone, 1979). Additional information on its use in the development of the test is available in ACCESS for ELLs Technical Report No. 1, Development and Field Test of ACCESS for ELLs (Kenyon, 2006). The test was developed using Rasch measurement principles, and in that sense, the Rasch model guided all decisions throughout the development of the assessment and was not just a tool for the statistical analysis of the data. Thus, for example, data based on Rasch fit statistics guided the inclusion, revision, or deletion of items during the development and field testing of the test forms.

For Listening, and Reading, the dichotomous Rasch model was used as the measurement model. Mathematically, the measurement model may be presented as

$$
\log \left(\frac{P_{n i 1}}{P_{n i 0}}\right)=B_{n}-D_{i}
$$

where:
$P_{n i 1}=$ probability of a correct response " 1 " by person " n " on item " i "
$P_{n i 0}=$ probability of an incorrect response " 0 " by person " n " on item " i "
$B_{n}=$ ability of person " n "
$D_{i}=$ difficulty of item " $i$ "
When the probability of a person getting a correct answer equals the probability of a person getting an incorrect answer (i.e., $50 \%$ probability of getting it right and $50 \%$ probability of getting it wrong), $P_{n i 1} / P_{n i 0}$ is equal to 1 . The $\log$ of 1 is 0 . This is the point at which a person's ability equals the difficulty of an item. For example, a person whose ability is 1.56 on the Rasch logit scale encountering an item whose difficulty is 1.56 on the Rasch logit scale would have a $50 \%$ probability of answering that question correctly.

For the Writing and Speaking tasks, a Rasch Rating Scale model was used. Mathematically, this can be represented as

$$
\log \left(\frac{P_{n i k}}{P_{n i k-1}}\right)=B_{n}-D_{i}-F_{k}
$$

where
$P_{n i k}=$ probability of person " n " on task " i " receiving a rating at level " k " on the rating scale $P_{n i k-l}=$ probability of person " n " on task " i " receiving a rating at level " $\mathrm{k}-1$ " on the rating scale (i.e., the next lowest rating)
$B_{n}=$ ability of person " n "
$D_{i}=$ difficulty of task " i "
$F_{k}=$ calibration of step "k" on the rating scale
All Rasch analyses were conducted using the Rasch measurement software program Winsteps (Linacre, 2006). Rasch statistics are presented in several of the tables that follow. When speaking of the measure of examinee ability, we use the term ability measure (rather than theta used commonly when discussing models based on Item Response Theory). When speaking of the measure of how hard an item was, we use the term item difficulty measure (rather than the $b$ parameter used commonly when discussing models based on Item Response Theory). Step measures refer to the calibration of the steps in the Rasch Rating Scale model presented above. All three measures (ability, difficulty, and step) are expressed in terms of Rasch logits, which then are converted into scores on the ACCESS score scale for reporting purposes (see ACCESS for ELLs Technical Report No. 1, Development and Field Test of ACCESS for ELLs [2006] for more details).

Rasch model standard errors also appear in the tables. These are an indication of the precision with which the measures have been estimated. Unlike the Standard Error of Measurement (SEM) based on classical test theory, which posits the same SEM for all persons, regardless of where on the ability distribution they are, Rasch model standard errors are conditional on the individual's ability measure. All things being equal, if a person gets few items correct or few items incorrect, the standard error of that person's measure will be greater than if a person gets a moderate number of items correct. In addition, for ability measures, standard errors are a function of the number of items on a test form as well as the distribution and quality of the items (i.e., their fit to the Rasch model).

Also included in some of the tables are fit statistics for the Rasch model. These statistics are calculated by comparing the observed empirical data with the data that would be expected to be produced by the Rasch model. Of the several statistics available, the mean square fit statistics were used to flag items in the development of ACCESS that needed to be deleted or revised and are presented in the appropriate tables. Outfit mean square statistics are influenced by outliers. For example, a difficult item that, for some reason, some low ability examinees get correct will
have a high outfit mean square statistic that indicates that the item may not be measuring the same thing as other items on the test. Infit mean square statistics are influenced by more aberrant response patterns and generally indicate a more serious measurement problem. The expectation for both of these statistics is 1.00 and values near 1.00 are not of great concern. Values less than 1.00 indicate that the observations are too predictable and thus redundant, but are not of great concern. High values are more of a concern.

Linacre (2002), the author of the Winsteps software program, provides more guidance on how to interpret these statistics for test items. He writes:

- values greater than 2.0 "distort or degrade the measurement system;"
- values between 1.5 and 2.0 are "unproductive for construction of measurement, but not degrading;"
- values between 0.5 and 1.5 should be considered "productive for measurement;" and
- values below 0.5 Linacre calls "less productive for measurement, but not degrading."

Linacre also states in his guidance that infit problems are more serious to the construction of measurement than are outfit problems.

Because conservative guidelines were followed in the development of ACCESS, the vast majority of items and tasks on the test forms have mean square fit statistics in the range of 0.75 and 1.25 , and fit the range that is "productive for measurement" according to the guidelines above.

### 5.1.2 Sampling

The results presented in most of the tables in Chapter 6 are based on the full data set of all students who were administered operational ACCESS 2.0 Series 400 Paper in the academic year 2015-2016, with the exception of some students as described in Section 3.1.

### 5.1.3 Equating and Scaling

Complete information on the horizontal and vertical scaling of ACCESS scores is provided in ACCESS for ELLs Technical Report No. 1, Development and Field Test of ACCESS for ELLs (2006). In brief, this scaling was accomplished during the field test based on an elaborate common item design, both across tiers and across grade-level clusters, which spanned two series of complete test forms. Concurrent calibration was used to determine item difficulty measures. These item difficulty measures were used to create the ACCESS scale scores used to report results on the test. Table D in Section 6 provides the equation for converting Rasch ability measures in logits to ACCESS scale scores for Listening and Reading. In the domains of Writing and Speaking, no scaling equation is provided, as a temporary logit scale was created solely for
the purpose of conducting the linking analysis, and scaling constants were not used to derive scale scores for Writing and Speaking for ACCESS 2.0 Series 400 Paper.

No equating summaries are provided for ACCESS 2.0 Series 400 Paper. In the domains of Listening and Reading, items were drawn from the ACCESS Series 302 assessment (see Section 1.3.3). In the domains of Writing and Speaking, the tasks were linked to ACCESS tasks via equipercentile linking (see Section 1.3.4.2).

### 5.1.4 DIF Analyses

Differential item analyses (DIF) attempt to investigate whether performances on items were influenced by factors extraneous to English language proficiency (i.e., the construct being measured on the test). In other words, they attempt to find items that may be functioning differently for different groups based on criteria irrelevant to what is being tested. The performance of students on ACCESS 2.0 Paper items was compared by dividing students into two different groupings: first, males versus females; second, students of Hispanic ethnic background versus students of all other backgrounds. (For both analyses, students for whom gender or ethnicity was missing were excluded.) Two commonly used procedures for detecting DIF were used: one for dichotomously scored items (Listening and Reading) and one for polytomously scored items (Writing and Speaking).

### 5.1.4.1 Dichotomous Items

Following procedures that were originally proposed by Educational Testing Service (ETS), the Mantel-Haenszel (M-H) Chi-square statistic (Mantel \& Haenszel, 1959) was used for dichotomous items. This procedure compares item-level performances of students in the two groups (e.g., males versus females) who are divided into subgroups based on their performance on the total test. It is assumed that, if there is no DIF, at any ability level (based on performance on the total test), a similar percentage of students in each group should get the item correct. The M-H Chi-square statistic is used to check the probability that the two groups performed similarly on each item across the ability groupings. The statistic is transformed into the "M-H delta" scale. This scale is symmetrical around zero, with a delta zero interpreted as indicating that neither group is favored. A positive result indicates that one group is favored; a negative result indicates that the other group is favored.

Because DIF is measured on a continuous scale, and because most items are likely to show some degree of DIF, it is useful to have guidelines to determine when the level of DIF is worrying. We follow the guidance provided by ETS to classify items into DIF levels as follows:

- A (no DIF), when the absolute value of delta was less than 1.0
- B (weak DIF), when the absolute value of delta was between 1.0 and 1.5
- C (strong DIF), when the absolute value of the delta was greater than 1.5

The software program EZDIF (Waller, n.d.) was used to run the DIF analyses for all forms containing dichotomous items. For each test form, the greatest number of ability level groupings is used; however, for many test forms, students scoring some of the lowest and highest raw scores need to be grouped together in order to have enough cases in each cell for the statistic to be appropriately calculated. (Note that this software program uses a two-step purification process; that is, items with C-level DIF in the first pass are removed from the matching variable in the second stage, and the DIF is then recalculated for the remaining items.)

For information on procedures for dealing with items with C-level DIF, see Section 1.4.5.

### 5.1.4.2 Polytomous Items

For polytomous items (i.e., Writing and Speaking tasks), a similar approach is used. It is based on the M-H Chi-square statistic and the standardized mean difference following procedures again developed by ETS. The DIF procedures developed by the ETS (Zwick, Donoghue, \& Grima, 1993; Allen, Carlson, \& Zalanak, 1999) for polytomous items were used for identifying tasks that exhibit DIF. JMetrik (Meyer, 2014), an open source computer program for psychometric analysis, was used in conducting the analyses. The procedures implemented in JMetrik first calculate the Cochran-Mantel-Haenszel Chi-square statistic and determine its probability of significance. This statistic gives an indication of the probability that observed differences are the result of chance but does not indicate how significant that difference is. To indicate how significant the difference is, the standardized mean difference (SMD) between the performances of the two groups being compared is calculated. The SMD compares the means of the two groups, adjusting for differences in the distribution of the two groups being compared across the values of the total raw scores. To standardize the outcome, this difference is divided by the item score range and serves as an effect size measure for the Cochran-Mantel-Haenszel Chi-square statistic. This effect size measure (reported as standardized P-DIF in JMetrik) ranges from -1 to 1, which may present some challenges when interpreting it. To mitigate this, the absolute value is taken in JMetrik (Meyer, 2014), thereby restricting the range of the rescaled effect size (standardized P-DIF*) to fall between 0 and 1. The effect size flagging criterion for polytomous items, proposed by ETS (Allen, Carlson, \& Zalanak, 1999), is also rescaled to the standardized P-DIF* metric (Meyer, 2014).

Following guidance proposed by ETS for the NAEP assessment (Allen, Carlson, \& Zalanak, 1999), ACCESS 2.0 Writing and Speaking tasks are classified into three DIF levels as follows:

- AA (no DIF), when the Cochran-Mantel-Haenszel Chi-square statistic is not significant or when it is significant and standardized P-DIF* is less than 0.05
- BB (weak DIF), when the Cochran-Mantel-Haenszel Chi-square statistic is significant and standardized P-DIF* is greater than or equal to 0.05 but less than 0.10
- CC (strong DIF), when the Cochran-Mantel-Haenszel Chi-square statistic is significant and standardized P-DIF* is greater than or equal to 0.10

Table B provides a summary of the findings of the DIF analyses at the top, followed by detailed information for each item or task. The first column gives the DIF level: $\mathrm{A}, \mathrm{B}$, or C for dichotomous items or $\mathrm{AA}, \mathrm{BB}$, or CC for polytomous tasks (i.e., Writing and Speaking tasks). The next columns show the contrasting groups in the DIF analyses: either male versus female or Hispanic versus other ethnicities. Even though DIF may be negligible (category A or AA), this table shows the number of items that favored one group or the other at all levels of DIF. Optimally, even when items are all in category A or AA, there should be roughly an even number of items favoring each of the two groups to ensure that there is no systematic biasing test effect across items.

Items and tasks which show C-level (or CC-level) DIF are investigated by a team of content experts to determine if any construct-irrelevant factors can be identified that may contribute to DIF. If such a factor is identified, that item or task will be removed from the test for the next operational year.

### 5.1.5 Analysis of Writing and Speaking Forms

As noted in Chapter 1, Section 1.2.5, ACCESS 2.0 Series 400 Paper has three tiers, and students' test booklets are printed with the tier designation (A, B, or C). In the Listening and Reading domains, Tiers A, B, and C are each different test forms. In Writing and Speaking, however, Tier B and Tier C tests are identical for every grade-level cluster.

In the analyses in Chapter 6, descriptive statistics for Writing and Speaking (distribution of raw score, scale score, and proficiency level) are computed separately for students who took the Tier B designation and students who took the Tier C designation. Statistics which apply to the test as a whole are computed by pooling all of the Tier B and Tier C students for the grade or gradelevel cluster, so that students who took the same form are included in the same analysis. Statistics presented in this fashion are included in Table F (Reliability), Table G (Complete Item Analysis and Summary), Table H (DIF Analysis and Summary), Table I (Raw Score to Scale Score Conversion), and Table J (Raw Score to Proficiency Level Conversion).

### 5.2 Descriptions of Tables and Figures

The following paragraphs describe the tables that follow and are repeated for each test form in each domain.

### 5.2.1 Raw Score Information (Figure A and Table A)

Figure A and Table A relate to the raw scores on each test form. Listening and Reading are scored dichotomously (i.e., correct or incorrect), thus, the highest possible score was the number of items on the test form.

The range for raw scores on the Writing test depends on the test form. For Grade 1 Tier A, the range is $0-44$. For all other grade-level clusters, the range on the Tier A test is $0-33$. For all Tier B or C tests, the range is $0-66$ (see Section 1.6.2 for more information on raw scores for Writing).

The range for raw scores on the Speaking test is either 0-18 (Tier A) or 6-30 (Tier B or Tier C) (see Section 1.6.3 for more information on raw scores for Speaking).

For each test form, Figure A shows the distribution of the raw scores. The horizontal axis shows the raw scores. The vertical axis shows the number of students (count). Each bar shows how many students were awarded each raw score.

Table A shows, by each grade and by total for the grade-level cluster:

- the number of students in the analyses (the number of students who were not absent, invalid, refused, exempt, or in the wrong grade-level cluster),
- the minimum observed raw score,
- the maximum observed raw score,
- the mean (average) raw score, and
- the standard deviation (std. dev.) of the raw scores.

### 5.2.2 Scale Score Information (Figure B and Table B)

Figure B and Table B relate to the ACCESS 2.0 Paper scale scores on each test form. For each test form, raw scores were converted to vertically-equated scale scores. (The raw score to scale score conversion table for each test form is presented as the second to last table—Table I—in each section.)

Thus, for each test form, Figure B shows the distribution of the scale scores. The horizontal axis shows the scale scores based on performances on the test form. To provide full perspective, it extends somewhat below and above the range of possible or observed scale scores. The vertical axis shows the number of students (count). Each bar shows how many students were awarded each scale score.

Table B shows, by each grade and by total for the grade-level cluster:

- the number of students in the analyses,
- the minimum observed scale score,
- the maximum observed scale score,
- the mean (average) scale score, and
- the standard deviation (std. dev.) of the scale scores.

Note that scale scores for Tier A and Tier B in Listening and Reading are capped. Within each grade, the highest possible scale score for Tier A is the scale score corresponding to the cut score for PL 4 (i.e., proficiency level score of 4.0). For Tier B, the highest possible scale score within each grade is the score corresponding to the cut score for PL 5 (i.e., proficiency level score of 5.0). Because of these grade-level cut scores, the scale score associated with a given proficiency
level score, as well as the cap, increase by grade within a grade-level cluster. For example, for Reading 6-8 Tier A, the scale score is capped at 360 for Grade 6, 369 for Grade 7, and 376 for Grade 8 (see Table 6.6.2.1B). Thus, a Grade 6 student with a raw score of 24 (out of 24) on that test will have a scale score of 360 , a Grade 7 student with the same raw score will have a scale score of 369 , and a Grade 8 student with the same raw score will have a scale score of 376 . However, all three students would have a proficiency level score of 4.0. For more information, see ACCESS for ELLs Technical Report No. 1, Development and Field Test of ACCESS for ELLs (Kenyon, 2006).

Also note that, because the scale is vertically equated, the range of scale scores moves up the scale from one grade-level cluster to the next. Thus, a Grade 2 student with a raw score of 0 on the Tier A Listening test would have a scale score of 108 , while a Grade 5 student with a raw score of 0 on the Tier A Listening test would have a scale score of 120.

Similarly, scale scores at the lower end may be truncated so that the lowest achievable proficiency level score is 1.0. Again, this results in a lower minimum scale score for students in lower grades within a grade-level cluster.

The influence of these caps will also be noticed in Figure B, as well as in many other tables throughout the report.

### 5.2.3 Proficiency Level Information (Figure C and Table C)

Figure C and Table C provide information on the proficiency level distribution of the students who took the test form based on their performance. Thus, for each test form, Figure C shows the information graphically for the grade-level cluster as a whole. The horizontal axis shows the six WIDA proficiency levels. The vertical axis shows the percentage of students. Each bar shows the percentage of students who were placed into each proficiency level in the domain being tested on this test form.

Each row of Table C shows, by grade and by total for the grade-level cluster:

- the WIDA proficiency level designation (1-6),
- the number of students (count) whose performance on the test form placed them into that proficiency level in the domain being tested, and
- the percentage of students, out of the total number of students taking the form who were placed into that proficiency level in the domain being tested.
(Note that for Kindergarten and Tier A tests in some domains, it was not possible to place into all proficiency levels. Figure C and Table C also clearly show the effect of the scoring cap on Tiers A and B.)

For Kindergarten this information is provided for scores based on both the Accountability cut scores and the Instructional cut scores.

### 5.2.4 Scaling Equation Table (Table D)

For each Listening and Reading test form, Table D provides the scaling equation for that domain. This equation is used to convert an examinee's ability measure into the scale score. Because ACCESS for ELLs is vertically equated (see Section 5.1.3 above), though each domain has its own equation, the same equation is used across all tiers and grade-level clusters within each domain. For Speaking and Writing, the scaling equation is not provided for Series 400, as scale scores were not derived from the logit scale directly (see Section 5.1.3 for further detail, as well as Section 1.3.4.2 for detail on the equipercentile linking methods).

### 5.2.5 Equating Summary (Table E)

No equating summaries are provided for Series 400 Paper. In the domains of Listening and Reading, items were drawn from the Series 302 assessment (see Section 1.3.3). In the domains of Speaking and Writing, the tasks were linked to ACCESS 1.0 tasks via equipercentile linking (see Section 1.3.4.2).

### 5.2.6 Test Characteristic Curve (Figure D)

For each test form in Listening and Reading, Figure D graphically shows the relationship between the ability measure (in logits) on the horizontal axis and the expected raw score on the vertical axis. Five vertical lines indicate the five cut scores for the highest grade in the gradelevel cluster for the test form, dividing the figure into six sections for each of the WIDA proficiency levels (PLs 1-6) for the domain being tested. (Note that for Kindergarten and Tier A tests in some domains, it was not possible to place into all six proficiency levels.) As would be expected, higher raw scores are required to be placed into higher proficiency levels. The relative width of each section between the cut score lines, however, gives an indication of how many items on that form must be answered correctly (or how many points on the Writing section must be earned) to be placed into a WIDA proficiency level.

As ACCESS 2.0 Series 400 Paper Listening and Reading forms are the same forms as were provided to students in the ACCESS Series 302 administration (see Section 1.3.3), no Test Characteristic Curve is presented.

For the Writing and Speaking domains, no Test Characteristic Curve is presented for Series 400. As described in Section 1.3.4.2, a temporary logit scale was created for Writing and Speaking tests solely for the purpose of conducting the linking analyses. These Writing and Speaking temporary logit scales are not on the ACCESS scales. Therefore, it is not informative to present the Test Characteristic Curve for Series 400 Writing and Speaking domains.

### 5.2.7 Test Information Function (Figure E)

With the Rasch measurement model, as with any measurement model following Item Response Theory, the relationship between the ability measure (in logits) and the accuracy of test scores can be modeled. It is recognized that tests measure most accurately when the abilities of the examinees and the difficulty of the items are most appropriate for each other. If a test is too
difficult for an examinee (i.e., the examinee scores close to zero), or if the test is too easy for an examinee (i.e., the examinee receives a perfect or near-perfect score), accurate measurement of the examinee's ability cannot be made. The test information function shows graphically how well the test is measuring across the ability measure spectrum. High values indicate more accuracy in measurement. Thus, for each test form in Listening and Reading, Figure E shows the relationship between the ability measure (in logits) on the horizontal axis and measurement accuracy, represented as the Fisher information value (which is the inverse squared of the standard error), on the vertical axis. The test information function, then, reflects the conditional standard error of measurement.

Again, as in Figure D, five vertical lines in Figure E indicate the five cut scores for the highest grade in the grade-level cluster for the test form, dividing the figure into six sections for each of the WIDA language proficiency levels (1-6) for the domain being tested. (Note that for Kindergarten and Tier A tests in some domains, it was not possible to place into all six proficiency levels. Note also that, although Listening and Reading scores on Tiers A and B were capped, all five horizontal lines indicating the cut points remain in this figure.) It is important that each test form measures most accurately in the areas for which it is primarily used to make classification decisions. In other words, optimally, the test information function should be high for the cuts between $1 / 2$ and $2 / 3$ for Tier A test forms; between $2 / 3,3 / 4$, and $4 / 5$ for Tier B test forms; and between $3 / 4,4 / 5$, and $5 / 6$ for Tier $C$ test forms.

As the Listening and Reading test forms for ACCESS 2.0 Series 400 Paper were the same forms as were provided to students in the ACCESS Series 302 administration (see Section 1.3.3), new test information function curves are not presented.

For ACCESS 2.0 Series 400 Paper, Figure E is provided only for Listening and Reading since Writing and Speaking task parameters are not on the ACCESS logit scale. As described in Section 1.3.4.2, a temporary logit scale was created for the Writing and Speaking tests solely for the purpose of conducting the linking analyses. These temporary logit scales and the ACCESS cut scores are not on the same scale. Therefore, it is not appropriate to present the test information function curves for the Writing and Speaking domains of ACCESS 2.0 Series 400 Paper.

### 5.2.8 Reliability (Table F)

In contrast to Figure E, which is based on the Rasch measurement model, Table F presents reliability and accuracy information based on classical test theory. It shows:

- the number of students,
- the number of items,
- Cronbach's coefficient alpha (as a measure of internal consistency), and
- the classical standard error of measurement (SEM) in terms of raw scores.

Cronbach's coefficient alpha is widely used as an estimate of reliability, particularly of the internal consistency of test items. It expresses how well the items on a test appear to measure the same construct. Conceptually, it may be thought of as the correlation obtained between performances on two halves of the test, if every possibility of dividing the test items in two were attempted. Thus, Cronbach's alpha may be low if some items are measuring something other than what the majority of the items are measuring. As with any reliability index, it is affected by the number of test items (or test score points that may be awarded). That is, all things being equal, the greater the number of items, the higher the reliability.

Cronbach's alpha is also affected by the distribution of ability within the group of students tested. All things being equal, the greater the heterogeneity of abilities within the group of examinees (i.e., the more widely the scores are distributed), the higher the reliability. In this sense, Cronbach's alpha is sample dependent. It is widely recognized that reliability can be as much a function of the test as of the sample of students tested. That is, the same test can produce widely disparate reliability indices based on the ability distribution of the group of examinees. Because ACCESS 2.0 Paper is a tiered test (that is, because each form in Tier A, B, or C targets only a certain range of the entire ability distribution), results for reliability on any one form, particularly for the shorter Listening test, may at times be lower than typically expected.

The formula for Cronbach's alpha is
$\alpha=\frac{n}{n-1}\left[1-\frac{\sum_{i=1}^{n} \sigma_{i}^{2}}{\sigma_{t}^{2}}\right]$
where
$n=$ number of items $i$
$\sigma_{i}{ }^{2}=$ variance of score on item $i$
$\sigma_{t}^{2}=$ variance of total score
Table F also presents the SEM based on classical test theory. Unlike Item Response Theory, in this approach, SEM is seen as a constant across the spread of test scores (ability continuum). Thus, it is not conditional on ability being measured. It is, however, a function of two statistics: the reliability of the test and the (observed) standard deviation of the test scores. It is calculated as
$\mathrm{SEM}=S D \sqrt{1-\text { reliability }}$
Traditionally, SEM has been used to create a band around an examinee's observed score, with the assertion in the view of classical test theory, that the examinee's true score (i.e., what the examinee's score would be if it could be measured without error) would lie with a certain degree of probability within this band. Statistically speaking, then, there is an expectation that an
examinee's true score has a $68 \%$ probability of lying within the band extending from the observed score minus 1 SEM to the observed score plus 1 SEM.

For the Writing tests (except Kindergarten, which is scored by the test administrator), information on interrater reliability for a sample of $20 \%$ of the task raters, is also provided in Table F. This portion of the table shows, for each of the tasks, the percentage of agreement between two raters. In this part of the table, the first column shows the task and the second column shows the number of responses that were double scored. DRC selects a sample of $20 \%$ of all responses scored, chosen at random during the operational scoring process. The next column shows the rates of agreement: exact, adjacent, and non-adjacent. For Writing, with 0-6 as defined levels and the possibility of awarding a "plus" score between levels (e.g., 3, 3+, or 4 are all valid scores), scores that match or are contiguous are categorized as agreement (for example, if Rater 1 assigns a score of 3+, a Rater 2 score of 3, 3+ or 4 is categorized as agreement). Scores that are one whole score point apart are categorized as adjacent (for example, if Rater 1 assigns a score of $3+$, a Rater 2 score of $2+$ or $4+$ is categorized as adjacent).

As the Speaking test is scored locally, it is not possible to provide interrater reliability data for Speaking. Section 1.6.3.1 describes training procedures that local raters must complete before being certified to administer and score the Speaking test.

### 5.2.9 Complete Item or Task Analysis and Summary (Table G)

Table G provides a summary of the analyses of the items (for Listening and Reading) or the tasks (for Writing and Speaking), along with analyses of each item or task. Table G has either two parts (Listening and Reading) or three parts (Speaking and Writing).

The first section of this table provides information about the total set of items or tasks, and includes the item type (selected response or constructed response), the average item difficulty (in logits), the number of items, the average p-value (for Listening and Reading only), the average infit mean square, and the average outfit mean square.

The second section of Table G presents results of the analyses of all of the items or tasks on the test form. For Listening, Reading, and Writing, the results for each tier are presented in a separate table. In these tables, first column provides the unique item name. The second column in this part of Table G presents the item difficulty in logits, while the third column indicates whether that item served as a common item across years (note that for ACCESS 2.0 Series 400 Paper, no items served as anchors, as explained in Section 5.2.5). For dichotomously scored items (Listening and Reading), the fourth column shows the p-value (percentage of correct answers on that item). The next two columns show the Rasch fit statistics for the item or task.

For the Speaking test, due to the design of the test, there are a number of items which are shared between tiers. In order to best present the results of the Speaking task analysis, all Speaking items in a grade-level cluster are presented in one single table; this table is repeated in its entirety for each tier in the text. A column to the right of the task name indicates whether the item is found on the Tier A or Tier B and C tests (recall that Tier B and Tier C are the same form for

Speaking). An asterisk indicates shared tasks. The intended proficiency level of the task (1, 3, or 5) is found in the next column. The remaining columns to the right-item difficulty, anchors, and fit statistics-are displayed as for Listening, Reading, and Writing, described above.

The final portion of Table G applies to Writing and Speaking only. This portion of the table provides raw score distributions by task.

### 5.2.10 DIF Analysis and Summary (Table H)

Table H presents results of DIF analysis by item or task, as well as a summary of items or tasks showing DIF for the form.

The top section of Table H presents a summary of DIF results, indicating how many items or tasks showed $\mathrm{A} / \mathrm{AA}, \mathrm{B} / \mathrm{BB}$, or $\mathrm{C} / \mathrm{CC}$ level DIF in the form, and which groups were favored.

The second section of Table H presents the same information for each item or task in the form.

### 5.2.11 Raw Score to Scale Score Conversion Chart (Table I)

The next table in this section, Table I, presents the raw score to scale score conversion table for the test form. The first column shows all possible raw scores. The following column(s) show the corresponding scale score for each grade in the grade-level cluster. Note that Tier A Listening and Reading items have been capped to the scale score that represents the proficiency level score of 4.0. Tier B Listening and Reading items have been capped to the scale score representing the proficiency level score of 5.0.

The next column shows the conditional standard error (i.e., from the Rasch analysis) in the metric of the scale score. The last two columns show a lower bound (i.e., the scale score minus one standard error) and an upper bound (i.e., the scale score plus one standard error) around the scale score. In some cases, the resulting lower bound is below 100, which has been set as the lowest score on the scale. In those cases, the lower bound has been set at 100 .

As can be clearly seen from the table, on any dichotomously scored test form, standard errors are very large at the lowest and highest ends of the raw score scale. Because of this phenomenon and because the scale scores are combined to form composite scores, the top scale scores for the Listening and Reading forms were often adjusted for an end-of-scale effect on Tier C by allowing the top scale scores to increase only at the same rate as the preceding scale scores. If they were not adjusted, their effect in the composite scores might be excessive.

Thus, if scale scores on the upper end of the raw score scale increased with each raw score by 9 scale points before the group of adjusted scores, then each of the adjusted scores would increase by only 9 scale points each. Because the lower and upper bounds were calculated based on the original logit scores, these adjusted scores do not fall in the middle of the range; they fall toward the lower end of the range, but always within the range. In other words, the adjusted scale score is a very possible observed score for that number of raw score points obtained.

Because the highest possible scores have been capped for Tiers A and B, preventing the inflation of scale scores due to large standard errors at the highest end of the raw score scale, there has been no need to make any other adjustment to the scale scores for these tiers at the extreme high end of the raw score range. Because the point at which scale scores are capped depends on the proficiency level associated with the score, the caps take effect at lower scores for lower grades within a grade-level cluster. In this case, the scores have been marked in Table I as capped, and the standard error, as well as the low and high bound for the capped scale score, has been repeated in the final rows of the table. In addition, at the lower end of the raw score scale, scale scores are truncated where necessary so that the lowest scale score given is the scale score corresponding to a proficiency level score of 1.0 . As with the adjusted scores, the standard error and the lower and upper bounds reported in Table I reflect the true scale score, not the truncated score.

Note additionally that for Writing and Speaking, for each grade-level cluster, the Tier B form is identical to the Tier C form. The tables are therefore simply repeated in the section for the Tier B form and the section for the Tier C form.

### 5.2.12 Raw Score to Proficiency Level Score Conversion Table (Table J)

The final table, Table J, shows the interpretive proficiency level score associated with each raw score. The first column in Table J shows the raw score. The remaining columns show the proficiency level score associated with each raw score/scale score for each grade in the gradelevel cluster, along with the percentage of students in that grade who scored at that raw score/scale score/proficiency level score.

There are two things to note about this table. First, unlike scale scores, which are determined psychometrically and have a one-to-one correspondence to raw scores regardless of the grade level of the student, proficiency level scores are interpretations of the scale score. In ACCESS Series 100 and Series 101, cut scores between proficiency levels were determined by grade-level cluster (e.g.., in Cluster 3-5, a given scale score was associated with the same proficiency level score for Grades 3,4 , and 5 students). Such a system, however, fails to take into account that older children can be expected to perform better on the test due to general cognitive growth beyond growth in English language proficiency. This effect can clearly be seen in Tables A and B, where average scores on any test form tend to rise, albeit slightly, by grade level. In order words, a Grade 5 student would be expected to perform better on the Cluster 3-5 test than a Grade 3 student at the same underlying level of English proficiency.

To account for this effect, the WIDA Consortium adopted grade-level cut scores beginning with ACCESS Series 102 so that, for any given raw score/scale score, its associated proficiency level score now differs according to the grade level of the student. (For details on how grade-level cut scores were determined, see Kenyon et al., 2013.) Hence, Table J includes a separate column for each grade.

The second note is, because scale scores for Tiers A and B in Listening and Reading are capped at the scale score corresponding to the proficiency level score of 4.0 (for Tier A) and 5.0 (for Tier B), beginning with ACCESS Series 102, this capped score is now dependent on the grade level (rather than dependent on the grade-level cluster). These differences are also shown in Table J on Tiers A and B for Listening and Reading.
Note additionally that for Writing and Speaking, for each grade-level cluster, the Tier B form is identical to the Tier C form. The tables are therefore simply repeated in the section for the Tier B form and the section for the Tier C form.

For Kindergarten, the proficiency level scores are provided, based on both the Accountability cut scores and the Instructional cut scores.

## 6. Analyses of Test Forms: Results

Chapter 6 contains proprietary test information and is not publicly available. State Educational Agency Representatives (SEAs) may request this information; please contact us at help@wida.us.

## 7. Analysis Across Tiers: Overview

### 7.1 Background

### 7.1.1 Reliability of Composites

Four composite scores are reported for ACCESS 2.0 Paper: Oral Language (Oral), Literacy (Litr), Comprehension (Cphn), and Overall Composite (Over). To estimate the reliability of these composite scores, a stratified Cronbach's alpha coefficient (e.g., Kamata, Turhan, \& Darandari, 2003; Kane \& Case, 2004; Rudner, 2001) is computed, weighted by the contribution of each domain score into the composite. Specifically, the formula is

$$
\alpha_{c}=1-\frac{\sum_{j=1}^{k} w_{j}^{2} \sigma_{j}^{2}\left(1-\rho_{j}\right)}{\sigma_{c}^{2}}
$$

where
$k=$ number of components $j$
$w_{j}=$ weight of component $j$
$\sigma_{j}{ }^{2}=$ variance of component $j$
$\sigma_{c}{ }^{2}=$ variance of composite
$\rho_{j}=$ reliability coefficient of component $j$.
The input to compute the stratified Cronbach's alpha is provided in the appropriate tables in Chapter 8.

Note that when Cronbach's alpha is computed for domains, as described in Section 5.2.8, the alpha is computed for each test form. When Cronbach's alpha is computed for the composites, it is computed by grade-level cluster. For example, for Grade 2, Cronbach's alpha for the domains of Listening and Reading is computed for the Cluster 1-2 Tier A, Tier B, and Tier C test forms. For the domains of Writing and Speaking, Cronbach's alpha is computed for the Cluster 2-3 Tier A test form and for the Tier B and C test form (recall Tier B and Tier C are the same form for Writing and Speaking). To compute Cronbach's alpha for the Grade 2 composites, the analysis is run at the grade-level cluster. The variance and the reliability at the grade-level cluster for each of the domains is presented, along with the variance and reliability of the composite.

### 7.1.2 Accuracy and Consistency of Classification

For each domain across tiers, as well as for the four composite scores, tables are provided that indicate estimates of the accuracy and consistency of classification of examinees into the WIDA proficiency levels based on their performance on the test. It is important to know the reliability of any student's test score and the degree of precision with which it has been measured (i.e., the estimate of the invariant standard error of measure [SEM] of classical test theory and the
estimate of the variable conditional standard error of the Rasch measurement model). However, because decisions about students are ultimately made on the basis of their classification into proficiency levels according to their performance on ACCESS 2.0 Paper, it is important to know how well these classifications are made. The analyses that were used utilize the methods outlined and implemented in Livingston and Lewis (1995) and Young and Yoon (1998) as implemented in the software program BB-CLASS (Brennan, 2004b) (cf. also Lee, Hanson, \& Brennan, 2002).

In the approach of Livingston and Lewis (1995), the accuracy of a decision is the extent to which decisions made on the basis of the administered test (i.e., the observed scores) would agree with those made if each student could somehow be tested with all possible parallel forms of the assessments; that is, the examinees' "true score." Meanwhile, the consistency of a decision is the extent to which decisions made on the basis of the administered test would agree with those made if each student were to take a different but parallel form of the test. Thus, in every analysis of classification, two parallel analyses are made: accuracy (vis-à-vis "true scores") and consistency (vis-à-vis a parallel test).

In terms of classifications around a single cut point, students can be misclassified in one of two ways. Students who were below the proficiency level cut score (based on their "true score"), but were classified based on the observed score as being above the cut score, are considered to be false positives. Students who were above the proficiency level cut score (based on their "true score"), but were classified as being below a cut score based on the observed score, are considered to be false negatives. All other students are considered to be accurately placed either above or below the cut score.

True scores are, of course, unknown. The approach taken by Livingston and Lewis (1995) and implemented here uses information about the reliability of the test, the cut scores, and the observed distribution of scores. Then, using a four-parameter beta distribution, the distribution of the true scores and of scores on a parallel form were modeled. Overall accuracy and consistency indices are produced by comparing the percentage of students classified across all categories the same way by both the observed distribution and modeled distribution. These indices indicate the percent of all students who would be classified into the same proficiency level by both the administered test and either the true score distribution (accuracy) or a parallel test (consistency). (These tables also provide an estimate of Cohen's kappa statistic, which is a very conservative estimate of the overall classification since it corrects for chance.)

Accuracy and consistency are also observed conditional on the proficiency level. These indices examine the percent of students classified by both tests into a proficiency level divided by all students classified into that Level according either to the true score distribution (accuracy) or a parallel test (consistency).

Finally, the most important set of indices may be the indices at the cut points. At every cut point, using the true score distribution (i.e., accuracy), the percentage of students who are consistently placed above and below the cut score is provided, as well as those who are false positives and false negatives. For consistency, only the percentage of students classified consistently above
and below the cut score is calculated. Thus, for example, to evaluate the degree of confidence that one can have in a decision made based on the Overall Composite score as to whether or not students are being accurately classified into PL 5 ("Bridging"), one can look at the accuracy index provided in the table for the cut score $4 / 5$.

### 7.2 Descriptions

### 7.2.1 Scale Score Information (Figure A and Table A)

Figure A and Table A relate to the ACCESS 2.0 Paper scale scores that were achieved by students in the grade-level cluster. Figure A shows the distribution of the scale scores. The horizontal axis shows the full range of all scale scores observed for the grade-level cluster. To provide a full perspective, it extends somewhat below and above the range of observed scale scores. The vertical axis shows the number of students (count). Each bar shows how many students were awarded each scale score. Note that, for Listening and Reading, the effects of capping the scores for Tier A and Tier B can often be clearly detected in this figure.

Table A shows, by grade and by total for the grade-level cluster:

- The number of students in the analyses (the number students who were not absent, invalid, refused, exempt, or in the wrong cluster),
- the minimum observed scale score,
- the maximum observed scale score,
- the mean (average) scale score, and
- the standard deviation (std. dev.) of the scale scores.

### 7.2.2 Proficiency Level Information (Figure B and Table B)

Figure B and Table B provide information on the proficiency level distribution of the students in the grade-level cluster. Figure B shows the distribution of the proficiency levels. The horizontal axis shows the six WIDA proficiency levels. The vertical axis shows the percentage of students. Each bar shows the percentage of students who were placed into each proficiency level.

Each row of Table B shows, by grade and by total for the grade-level cluster:

- The WIDA proficiency level designation (1-6),
- the number of students (count) whose performance on the test form placed them into that proficiency level in the domain being tested, and
- the percentage of students, out of the total number of students taking the form within a grade or within the total of students in the grade-level cluster, who were placed into that proficiency level in the domain being tested.

For Kindergarten, this information is provided for scores based on both the Accountability cut
scores and the Instructional cut scores.

### 7.2.3 Conditional Standard Error of Measurement at Cut Scores (Table C)

Table C and Figures C and D provide information across the three overlapping tiers within a grade-level cluster and on the comparative conditional standard error of measurement (CSEM). Note that this information applies only to the domain scores; this information is not applicable to the composite scores.

Table C presents information on the CSEM at the most important points at which decisions are made about students, based on performance on ACCESS 2.0 Paper-the cut points between proficiency levels. Because the cut points depend on grade level, information is provided for each grade within the grade-level cluster. The leftmost column shows the cut (e.g., $1 / 2$, which is the cut score between PL 1 and PL 2). The next column shows the grade level. The next column shows the cut score in the scale score metric (e.g., 305). In the last column(s), the corresponding CSEM is given for each cut score in the scale score metric. For Kindergarten, the SEMs are provided in separate tables for the accountability and instructional cut scores. For each of the other grade-level clusters, the SEMs for the cut scores are provided in one table for the tiers (A, B, and C).

From this table it is possible to examine how well the different tiers are targeted for making decisions about students at the various cut scores. For example, Tier A is intended for students at the lowest end of the language proficiency continuum. Optimally, Tier A forms should have the lowest CSEM of any tier at the $1 / 2$ cut point, and a relatively low CSEM at the $2 / 3$ cut point. At the other end of the continuum, Tier C forms should optimally have the lowest CSEM at the 5/6 cut point, and a relatively low CSEM at the $4 / 5$ cut point. Tier B should have low CSEM in the middle range. Information from this table provides comparable information on how well the three tiers are targeted to provide the most accurate measure in order to place their intended examinees into the proficiency levels that they target. (Note that, because of the capping of scores on Tiers A and B, there is no information given for some of the cuts.)

As described in Section 1.3.4.2, the CSEM from the equated ACCESS Series 303 Writing and Speaking scale scores are used to approximate the CSEM for ACCESS 2.0 Series 400 scale scores. These CSEM are approximations since there were obtained through the equipercentile relationship between ACCESS Series 303 and ACCESS 2.0 Series 400 scale scores. Since the ACCESS Series 303 Speaking test was not tiered, the CSEM at the cut scores for Speaking are presented by grade-level cluster.

### 7.2.4 Test Characteristic Curve (Figure C)

Figure C shows the test characteristic curve across the entire test for Kindergarten and across the three tiers for the other grade-level clusters. (Note that this information applies only to the domain scores; this information is not applicable to the composite scores. For ACCESS 2.0 Series 400, it applies to Listening and Reading only.) It shows graphically how the tiers differ in difficulty. Tier A is represented by a dotted curve, Tier B by a light solid curve, and Tier C by a
dark solid curve. Note that not all tiers have the same number of items. Thus, some curves for Listening and Reading in this figure may not end at the top horizontal line. Five vertical lines in the graphic indicate the cut scores at the highest grade in each cluster only.

### 7.2.5 Test Information Function (Figure D)

Figure D compares the test information function across the entire test for Kindergarten and across the three tiers for the other grade-level clusters. (Note that this information applies only to the domain scores; this information is not applicable to the composite scores. For ACCESS 2.0 Series 400, it applies to Listening and Reading only.) This figure reflects the SEM columns in Table C. Again, Tier A is represented by a dotted curve, Tier B by a light solid curve, and Tier C by a dark solid curve. As in Figure C, the cut scores at the highest grade in each grade-level cluster are indicated by vertical lines. These lines make it easy to see which form measures most accurately at which cut score.

### 7.2.6 Reliability Information (Table D)

In order to produce accuracy and consistency of classification tables, it was necessary to produce a single reliability estimate across the three tiers. For the domains, this was a weighted reliability estimate (Cronbach's alpha). In other words, it is the average reliability weighted by the number of students who were administered that test form. Thus, Table D, based on the information from Table F in Chapter 6, provides the number of students and the reliability estimate for each tier. The final column presents the weighted reliability, which is an estimate of the reliability of the scale scores across the tiers.

For the composite scores, Table D presents the data used to calculate an estimate of the reliability of the composite using stratified Cronbach's alpha (see Section 7.1.1). The first column shows the components forming the composite, the second column shows the weight of the composite in the total score, the third shows the variance of the scale scores, and the fourth shows the reliability of the composite. (Note that these are the weighted reliabilities across the tiers.) Unlike the weighted composite, which is an average, the stratified alpha reflects the fact that there are $2-4$ measures being combined into one single measure. Thus, the reliability of the composite score will be higher than the reliability of any single sub-score within the composite.

### 7.2.7 Accuracy and Consistency of Classification Tables (Table E)

Table E presents three rows of information related to the accuracy and consistency of placement into the WIDA proficiency levels (see Section 7.1.2). With the adoption of grade-level cut scores with ACCESS Series 102, placement within a proficiency level now depends on the grade level of the student. Therefore, separate tables for each grade in a grade-level cluster are provided. The first row provides overall indices related to the accuracy and consistency of classification, as well as Cohen's kappa. The second row of information shows accuracy and consistency information conditional per proficiency level. The third provides indices of classification accuracy and consistency at the cut points. These indices are perhaps the most important of all
when using any of these as an absolute cut-point (i.e., determining which students have reached PL 6). Note that the consistency is generally higher at the cut points than over the proficiency levels. For practical purposes, the primary score used for such decisions are the Overall Composite scores.

Because of the scoring caps placed on Listening and Reading, there are several cases where there were no test takers placed into the proficiency level and accuracy of classification conditional on that level cannot be computed. In these cases, 'NA' has been placed in the table. In addition, there are a few cases where due to the small percentage of test takers placed into the proficiency level and the range of observed scale scores, accuracy of classification conditional on that level cannot be estimated by BB-CLASS. In such cases, a hyphen (-) has been placed in the table. For Writing, these results can also occur in higher proficiency levels.

For Kindergarten, these tables are provided for both the accountability cut scores and the instructional cut scores.

[^0]:    ${ }^{1}$ The grade-level clusters are $1,2-3,4-5,6-8$, and $9-12$. The Listening and Reading tests are based on MPIs aligned with the ACCESS 1.0 cluster structure. See Section 1.3 for further detail.

[^1]:    ${ }^{2}$ The ELD Standards, the MPIs, and sample items are available at the WIDA website, www.wida.us.

[^2]:    ${ }^{3}$ Students with very low ability levels in the Listening and Reading domains are routed to the pre-A tier for Speaking on the Online test. The purpose of the pre-A tier is to reduce the affective impact of the test on these students. As the Paper test is not adaptive, there is no way to route these students to pre-A for Paper.

[^3]:    ${ }^{4}$ Note: The 2005 ACCESS for ELLs field test and standard setting were based on the 2004 WIDA ELP standards. The WIDA English Language Proficiency (ELP) Standards (2004, 2007) were amplified in 2012 to become English Language Development (ELD) Standards (WIDA, 2012). In this section, the Standards are referred to as ELD standards for consistency. A new standard setting study was conducted in summer 2016, and new scale score cut points will be applied to ACCESS 2.0 (Paper and Online) beginning with the 2016-17 operational year of testing.
